This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

THE THEORY

OF

THE CONTINUOUS GIRDER:

Its Application to Girders with and without Variable Cross-sections,

BY

MALVERD A. HOWE, C. E.,

Professor of Civil Engineering, Rose Polytechnic Institute.

PREFACE.

Continuous bridges—with the exception of draw bridges—are not considered economical and are not designed by American engineers. This probably accounts for the brief treatment the theory of the continuous girder receives in text books and engineering literature.

With one or two exceptions, all American treatises consider the moment of inertia as constant and deduce *two* equations for the moment over any support, one to be applied when the loads are on the left of the support and the other when the loads are on the right. These two equations combined would, of course, give the moment over any support for any load, but only when the moment of inertia could be assumed as constant, as in girders with parallel flanges, where it might be undue refinement to consider the cross-section as variable.

American engineers have, until recently, assumed the moment of inertia as constant even when the flanges of the girder were considerably inclined, as in the Sabula draw bridge, relying upon the *factor of ignorance* to cover all discrepancies which might arise from the assumption. A few years ago the modulous of elasticity was quite variable in large bridges—though all engineers considered it as constant in computations—but now, since experience shows that iron and steel can be manufactured with, practically, a constant modulus of elasticity, it may safely be considered as constant, without leading to any appreciable error.

Although no material may be saved by considering the

moment of inertia as variable yet, if it is so considered, the material will be placed where it will do the best service.

Girders with inclined chords, computed and designed as if their cross-sections were constant, have more material than is necessary in some of the compression pieces, and not enough in some of the tension members, as is clearly shown by the results on page 77 of the text.

The object of the following pages is to present to computers, engineers and students a complete mathematical treatment of the theory of the continuous girder, and show how it can be applied to any girder—especially to fixed girders and girders of two and three spans—under any conditions.

With the single assumption that the modulous of elasticity is constant a general equation has been deduced for the moment over any support of any girder under any conditions of loading, of any length of spans, of variable or constant cross-section and for supports at any level.—By difference of level of the supports is meant any change of level which may take place when the girder is in position. It is evident that such a change alone would affect the moments.—From this equation special equations are readily deduced for any particular case. To illustrate the simplicity of the transformations necessary for any special case and also for the convenience of engineers, equations have been given for all the special cases usually discussed in text books, and also equations for these cases when the moment of inertia is considered as variable.

The usual general equations for reactions, deflections and intermediate moments and their transformed equations for special cases are also presented.

Several examples are solved to illustrate the application of the formulas and to show that the processes are almost mechanical when the formulas are thoroughly understood. From those examples which are solved considering the moment of inertia as constant and then variable, a good idea of the manner in which the moment of inertia affects the

results can be obtained. In the case of the Sabula draw there is a difference of about twenty per cent.

In all pin connected bridges the loads are considered to be concentrated at the apices or panel points. In computing the moments for such girders Table I. will be found to be very convenient, as in it are found expressions for $2k-3k^2+k^3$ and $k-k^3$ for all values of $k=\frac{a}{l}$ from 0.001 to 0.999 inclusive.

The works enumerated under References, page 107, have been consulted, and some of their parts used without any material change, for which credit is given in foot notes.

The author is indebted to R. H. Brown, C. E., and Geo. H. Hutchinson, C. E., for valuable assistance and suggestions.

SUMMARY.

Summary of contents 111–119

NOMENCLATURE.

r=The number of the support just at the *left* of the r^{th} span.

l_r=The horizontal length of the span r.

P_r=Any concentrated load in the r^{th} span.

w_r=Any uniform load, per lineal foot, in the r^{th} span.

a_r=The distance from the left support r to any concentrated load P_r. $a_r = k_r\, l_r$.

a_r'=The distance from the support r to the point where the uniform load ends in the r^{th} span.

a_r''=The distance from the left support r to the point where the uniform load begins in the r^{th} span.

$k_r = \frac{a_r}{l_r}$, or, $a_r = k_r\, l_r$.

x_r=The distance from the left support r to any point in the r^{th} span.

M_r=The bending moment over the support r.

M_m=The bending moment over any support m.

M_x=The bending moment at any section, x_r from the support r.

M_c=The bending moment at the center of any span of a girder.

S_r=The shear just at the *right* of the support r.

S_r'=The shear just at the *left* of the support r.

R_r=The reaction at the support r, and equals $S_r + S_r'$.

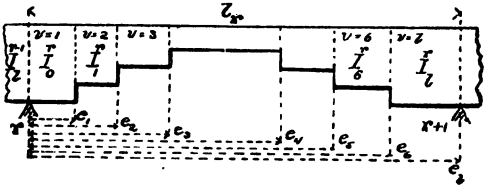
h_r=The distance the support r is below some specified horizontal line of reference.

Σ=Sign of summation.

t_r=Tangent of the angle that the elastic line makes with the horizontal over the support r.

y_r=The deflection of the girder at any section x_r; y_r is measured from the horizonal line of reference.

s=The number of spans.



e_1=The distance from the left support r to the point where the moment of inertia of the section of the girder changes for the first time in the span r.

e_2=The distance to the point where it changes the second time.

e_v=The distance to any point where the moment of inertia changes, always measured from the left support r and in the span r.

I_l^r=The moment of inertia between the last value of e_v and the end of the r^{th} span. See Fig.

I_0^r=The moment of inertia between the support r and the point e_1.

I_1^r=The moment of inertia between e_1 and e_2 in the r^{th} span.

I_x^r=The moment of inertia at any section in the r^{th} span.

E=The modulus of elasticity.

GENERAL RELATIONS.

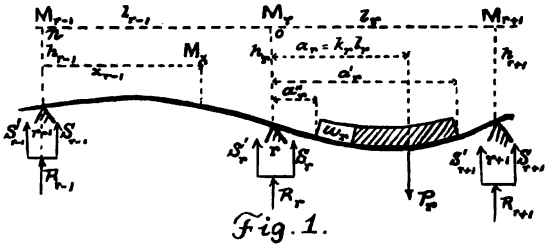


Fig. 1.

* In the r^{th} span of a continuous girder, whose length is l_r, Fig. 1, take a point o vertically above the r^{th} support, as the origin of co-ordinates, and the horizontal through o as the axis of abscissas. Suppose any section of the girder at a distance x_r from the left support r, and between this section and the support r a weight P_r distant from r, $a_r = k_r\, l_r$.

Now, if the girder is continuous over any number of supports there will be a bending moment over each of them (if the ends are not fixed the bending moment over the first and last support will equal zero): M_{r-1} over $r-1$, M_r over r, M_{r+1} over $r+1$, etc., also, there will be a shear S_r just at the right and S'_r just at the left of r, S_{r+1} just at the right and S'_{r+1} just at the left of $r+1$, etc. If there is equilibrum the following conditions must be fulfilled:

---

* See "Continuirlichen Und Einfachen Träger," page 4, by Prof. Weyrauch.
"Theory and Calculation of Continuous Bridges," page 52, by Prof. Merriman.
"Strains in Framed Structures," page 244, by Prof. DuBois.

I. *The algebraic sum of all the horizontal forces must be zero.*

II. *The algebraic sum of all the vertical forces must be zero.*

III. *The algebraic sum of the moments of all the forces must be zero.*

From the third condition we have for any section in the r^{th} span,

$$M'_x = M_r + S_r\, x_r - P_r\,(x_r - a_r) \quad \ldots \quad x_r > a_r \quad \ldots \quad (1)$$

If in (1) we make $x_r = l_r$, $M'_x = M_{r+1}$, and it becomes

$M_{r+1} = M_r + S_r\, l_r - P_r\,(l_r - a_r)$, or, since $a_r = k_r\, l_r$, we have

$$M_{r+1} = M_r + S_r\, l_r - P_r\, l_r\,(1 - k_r) \quad \ldots \quad (2)$$

From (2),

$$S_r = \frac{M_{r+1} - M_r}{l_r} + P_r\,(1 - k_r) \quad \ldots \quad (3)$$

And if there is no load in the span r this becomes

$$S_r = \frac{M_{r+1} - M_r}{l_r} \quad \ldots \quad (4)$$

$S'_{r+1} = P_r - S_r$, therefore from (3),

$$S'_{r+1} = \frac{M_r - M_{r+1}}{l_r} + P_r\, k_r, \text{ or better,}$$

$$S'_r = \frac{M_{r-1} - M_r}{l_{r-1}} + P_{r-1}\, k_{r-1} \quad \ldots \quad (5)$$

And if there is no load in the span $r-1$, (5) becomes

$$S'_r = \frac{M_{r-1} - M_r}{l_{r-1}} \quad \ldots \quad (6)$$

The reaction at any support equals the sum of the shears at that support, or

$$R_r = S_r + S'_r \quad \ldots \quad (7)$$

The above formulas were deduced under the supposition that there was but a single concentrated load P_r in the span r. If there be more than one concentration, the formulas become:

$$(1)\quad M_x^r = M_r + S_r\, x_r - \Sigma\, P_r\,(x_r - a_r) \quad . \quad . \quad . \quad x_r \gtrless a_r \quad . \quad . \quad . \quad . \quad (8)$$

$$(2)\quad M_{r+1} = M_r + S_r\, l_r - \Sigma\, P_r\, l_r\,(1 - k_r) \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (9)$$

$$(3)\quad S_r = \frac{M_{r+1} - M_r}{l_r} + \Sigma\, P_r\,(1 - k_r) \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (10)$$

$$(5)\quad S_r' = \frac{M_{r-1} - M_r}{l_{r-1}} + \Sigma\, P_{r-1}\, k_{r-1} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (11)$$

Any partial uniform load in span r.—If w_r represents the uniform load per lineal foot in the span r, we can write

$$\Sigma\, P_r = \int_{a_r = a_r''}^{a_r = a_r'} w_r\, da_r \quad \text{or, since } a_r = k_r\, l_r$$

THESE LIBRARY OF THE UNIVERSITY CALIFORNIA.

$$\Sigma\, P_r = \int_{a_r'' = k_r\, l_r}^{a_r' = k_r\, l_r} w_r\, l_r\, d\, k_r = (w_r\, l_r\, k_r) \quad \begin{matrix} k_r = \frac{a_r'}{l_r} \\ k_r = \frac{a_r''}{l_r} \end{matrix} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (12)$$

The last expression in (12) indicates the difference of the values of the parenthesis when k_r equals $\frac{a_r'}{l_r}$ and $\frac{a_r''}{l_r}$ respectively.

Substituting (12) in the above equations, we have,

From (8),

$$M_x^r = M_r + S_r\, x_r - \int_{a_r''}^{a_r'} w_r\, l_r\, d\, k_r\,(x_r - k_r\, l_r) \quad . \quad . \quad . \quad x_r \gtrless a_r' \quad . \quad . \quad . \quad . \quad (13)$$

From (9),

$$M_{r+1} = M_r - S_r\, l_r - w_r\, l_r^2 \int_{a_r''}^{a_r'} d\, k_r\, (1 - k_r) \quad \ldots\ldots\ldots\ldots (14)$$

Or

$$M_{r+1} = M_r + S_r\, l_r - w_r\, l_r^2 \left(k_r - \frac{1}{2} k_r^2\right)_{k_r = \frac{a_r''}{l_r}}^{k_r = \frac{a_r'}{l_r}} \quad \ldots\ldots\ldots\ldots (15)$$

From (10),

$$S_r = \frac{M_{r+1} - M_r}{l_r} + w_r\, l_r \left(k_r - \frac{1}{2} k_r^2\right)_{k_r = \frac{a_r''}{l_r}}^{k_r = \frac{a_r'}{l_r}} \quad \ldots\ldots\ldots\ldots (16)$$

From (11),

$$S_r' = -\frac{M_{r-1} - M_r}{l_{r-1}} + \frac{1}{2} w_{r-1}\, l_{r-1}\, k_{r-1}^2 \Big|_{k_{r-1} = \frac{a_{r-1}''}{l_{r-1}}}^{k_{r-1} = \frac{a_{r-1}'}{l_{r-1}}} \quad \ldots\ldots\ldots\ldots (17)$$

Uniform load over entire span r.—If the entire span is uniformly loaded, we have $a_r' = l_r$, $a_r'' = o$ and $a_r = \frac{1}{2} l_r$.

From (13), (In this case $a_r' = x_r$, $a_r'' = o$ and $a_r = \frac{1}{2} x_r$ since the load considered cannot extend beyond x_r).

$$M_x' = M_r + S_r\, x_r - \frac{1}{2} w_r\, x_r^2 \quad \ldots\ldots\ldots\ldots (18)$$

From (15),

$$M_{r+1} = M_r + S_r\, l_r - \frac{1}{2} w_r\, l_r^2 \quad \ldots\ldots\ldots\ldots (19)$$

From (16),

$$S_r = \frac{M_{r+1} - M_r}{l_r} + \frac{1}{2} w_r l_r \quad \ldots \ldots \ldots \ldots \ldots \quad (20)$$

From (17),

$$S'_r = \frac{M_{r-1} - M_r}{l_{r-1}} + \frac{1}{2} w_{r-1} l_{r-1} \quad \ldots \ldots \ldots \ldots \ldots \quad (21)$$

These twenty-one general equations apply to all spans and conditions of loading, but before they can be solved, it will be necessary to find expressions for M or S in terms of the loads, lengths of the spans, etc.

This can be done by introducing the equation of the *elastic line* and the theorem of *three moments*. The following expression is obtained for the bending moment over any support m; E *alone, being constant.*

$$*M_m = \frac{-c_m \beta_2 \beta_3 \ldots \beta_{m-1}}{(d_{s+1} \beta''_1) \beta''_2 \ldots \beta''_{m-1}} \sum_{r=s}^{r=m} \left\{ (A_r + Y_r + X'_r + X''_{r-1}) d_{s-r+2} + B_r d_{s-r+1} \right\}$$

$$+ \frac{-d_{s-m+2} \beta''_{s-1} \beta''_{s-2} \ldots \beta''_m}{(c_{s+1} \beta_s) \beta_{s-1} \beta_{s-2} \ldots \beta_m} \sum_{r=m-1}^{r=1} \left\{ (A_r + Y_r + X'_r + X''_{r-1}) c_r + B_r c_{r+1} \right\} \quad (A)$$

$$\beta''_{s-1} \gtrless \beta''_m. \quad \beta_{s-1} \gtrless \beta_m. \quad \beta_2 \lessgtr \beta_{m-1}. \quad \beta''_2 \lessgtr \beta''_{m-1}.$$

In which the respective expressions have the following values:

* A complete demonstration of this equation is given in the Appendix and should be thoroughly understood before any attempt is made to apply equation A practically.

A_r

Concentrated loads—

$$A_r = -\Sigma P_r l_r^2 (2k_r - 3k_r^2 + k_r^3)\theta_{r-1} \quad \text{See (57)} \quad (i)$$

Partial uniform load—

From (12),

$$k_r = \frac{a_r'}{l_r}$$

$\Sigma P_r = w_r l_r (k_r)$ therefore (i) becomes

$$k_r = \frac{a_r''}{l_r}$$

$$A_r = -w_r l_r^2 \left\{ k_r^2 - k_r^3 + \frac{k_r^4}{4} \right\} \begin{matrix} a_r' = k_r l_r \\ \theta_{r-1} \\ a_r'' = k_r l_r \end{matrix} \quad (74)$$

Uniform load over all—

$$A_r = -\frac{1}{4} w_r l_r^2 \theta_{r-1} \quad (75)$$

B_r

Concentrated loads—

$$B_r = -\Sigma P_r l_r^2 (k_r - k_r^2)\theta_{r-1} \quad \text{See (58)} \quad (j)$$

Partial uniform loads—

$$B_r = -w_r l_r^2 \left\{ \frac{2k_r^2 - k_r^4}{4} \right\} \begin{matrix} a_r' = k_r l_r \\ \theta_{r-1} \\ a_r'' = k_r l_r \end{matrix} \quad (76)$$

Uniform load over all—

$$B_r = -\frac{1}{4} w_r l_r^2 \theta_{r-1} \quad (77)$$

X'_r

Concentrated loads—

$$X'_r = -F'_r \sum P_r\, l_r\, (1-k_r)\, \theta_{r-1} + H_r\, \theta_{r-1} \quad \ldots\ldots\ldots (h)$$

Partial uniform load—

$$X'_r = -F'_r\, w_r\, l_r^2\, \theta_{r-1} \left\{ k_r - \frac{1}{2}\, k_r^2 \right\}_{\substack{a'_r = k_r\, l_r \\ a''_r = k_r\, l_r}} + H_r\, \theta_{r-1} \quad \ldots (78)$$

Uniform load over all—

$$X'_r = -\frac{1}{2}\, F'_r\, w_r\, l_r^2\, \theta_{r-1} + H_r\, \theta_{r-1} \quad \ldots\ldots\ldots\ldots (79)$$

X''_{r-1}

Concentrated loads—

$$X''_{r-1} = -2\, F''_{r-1} \sum P_{r-1}\, l_{r-1}\, (1-k_{r-1})\, \theta_r - H'_{r-1}\, \theta_r \ldots \text{See (59)} \ldots (h)$$

Partial uniform load—

$$X''_{r-1} = -2\, F''_{r-1}\, \theta_r\, w_{r-1}\, l_{r-1}^2 \left\{ k_{r-1} - \frac{1}{2} k_{r-1}^2 \right\}_{\substack{a'_{r-1} = k_{r-1}\, l_{r-1} \\ a''_{r-1} = k_{r-1}\, l_{r-1}}} - H'_{r-1}\, \theta_r \quad \ldots (80)$$

Uniform load over all—

$$X''_{r-1} = -F''_{r-1}\, \theta_r\, w_{r-1}\, l_{r-1}^2 - H'_{r-1}\, \theta_r \quad \ldots\ldots\ldots\ldots (81)$$

H_r

Concentrated loads—

$$H_r = \sum_{v=l_r}^{v=1} \left\{ \frac{\sum l_r\, (e_v - a_r)^3}{l_r} + \frac{3\,(l_r - e_v)}{l_r} \sum P_r\, (e_v - a_r)^2 \right\} \quad \ldots (f)$$

Partial uniform load—

Substitute the following expressions in (f):

$$\Sigma P_r (e_v - a_r)^3 = \int_{a_r''}^{a_r'} w_r \, d a_r \, (e_v - a_r)^3 \quad . \quad . \quad . \quad . \quad a_r' \leq e_v \quad . \quad . \quad . \quad . \quad (82)$$

$$\Sigma P_r (e_v - a_r)^2 = \int_{a_r''}^{a_r'} w_r \, d a_r \, (e_v - a_r)^2 \quad . \quad . \quad . \quad . \quad a_r' \leq e_v \quad . \quad . \quad . \quad . \quad (83)$$

Probably the easiest way to handle this case is to consider the uniform load as extending from the left support to the farther end of the load and integrate between the limits $a_r' \leq e_v$ and $a_r'' = o$; then consider the load as extending from the left support to the nearer end of the load and integrate between the limits $a_r' = a_r'' \leq e_v$ and o, and take the difference of the results.

Uniform load over all—

$$\Sigma P_r (e_v - a_r)^3 = \int_o^{e_v} w_r \, d a_r \, (e_v - a_r)^3 = \frac{1}{4} w_r \, e_v^4 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (84)$$

$$\Sigma P_r (e_v - a_r)^2 = \int_o^{e_v} w_r \, d a_r \, (e_v - a_r)^2 = \frac{1}{3} w_r \, e_v^3 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (85)$$

$$H_r'$$

Concentrated loads—

$$H_r' = \sum_{v=1}^{v=r} \left(\frac{\Sigma P_r (e_r - a_r)^3}{l_r} - \frac{3 e_r}{l_r} \Sigma P_r (e_v - a_r)^2 \right) \quad . \quad . \quad . \quad (g)$$

Partial uniform load—

$$\Sigma P_r (e_v - a_r)^3 = \int_{a_r''}^{a_r'} w_r \, d\, a_r \, (e_v - a_r)^3 \quad . \quad . \quad . \quad a_r' \leq e_v \quad . \quad . \quad . \quad . \quad . \quad . \quad (82)$$

$$\Sigma P_r (e_v - a_r)^2 = \int_{a_r''}^{a_r'} w_r \, d\, a_r \, (e_v - a_r)^2 \quad . \quad . \quad . \quad a_r' \leq e_v \quad . \quad . \quad . \quad . \quad (83)$$

Uniform load over all—

$$\Sigma P_r (e_v - a_r)^3 = \int_0^{e_v} w_r \, d\, a_r \, (e_v - a_r)^3 = \frac{1}{4} w_r \, e_r^4 \quad . \quad . \quad . \quad . \quad . \quad . \quad (84)$$

$$\Sigma P_r (e_v - a_r)^2 = \int_0^{e_v} w_r \, d\, a_r \, (e_v - a_r)^2 = \frac{1}{3} w_r \, e_r^3 \quad . \quad . \quad . \quad . \quad . \quad . \quad (85)$$

For all loads—

$$F_r = \sum_{v=l_r}^{v=1} \overset{r}{\underset{v}{\triangle}} \left\{ e_v \left(3 - \frac{3 e_r}{l_r} + \frac{e_r^2}{l_r^2}\right) = \frac{l_r^3 - (l_r - e_r)^3}{l_r^2} \right\} \text{ See (48) . . } (b)$$

$$F_r' = \sum_{v=l_r}^{v=1} \overset{r}{\underset{v}{\triangle}} e_r^2 \left\{ \frac{3}{l_r} - \frac{2 e_v}{l_r^2} \right\} \quad . \quad . \quad . \quad . \quad \text{See (49)} \quad . \quad . \quad . \quad . \quad (c)$$

$$F_r'' = \sum_{v=l_r}^{v=1} \overset{r}{\underset{v}{\triangle}} e_r^2 \frac{1}{l_r^2} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad \text{See (50)} \quad . \quad . \quad . \quad (d)$$

$$\overset{r}{\underset{v}{\triangle}} = \frac{\overset{r}{I_l}}{\underset{r}{I_{v-1}}} - \frac{\overset{r}{I_l}}{\underset{r}{I_v}} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (a)$$

$$\beta_r=(l_r+F_r')\ \theta_{r+1} \quad \text{See (60)} \quad (m)$$

$$\beta_r'=(l_{r-1}+F_{r-1}'')\ \theta_r+(l_r+F_r)\ \theta_{r-1} \quad \text{See (61)} \quad (n)$$

$$\beta_r''=(l_r+F_r')\ \theta_{r-1} \quad \text{See (62)} \quad (o)$$

$$Y_r=-\theta_r\ \theta_{r-1}\left\{\frac{h_r-h_{r-1}}{l_{r-1}}+\frac{h_r-h_{r+1}}{l_r}\right\} \quad \text{See (56)} \quad (l)$$

$$\theta_r=6\ E\ I_l^r \quad \text{See (51)} \quad (e)$$

$$c_1=o. \qquad c_2=1.$$

$$c_m=-2\ c_{m-1}\frac{\beta_{m-1}'}{\beta_{m-1}}-c_{m-2}\frac{\beta_{m-2}''}{\beta_{m-1}} \quad \text{See (66)} \quad (p)$$

$$d_1=o. \qquad d_2=1.$$

$$d_m=-2\ d_{m-1}\frac{\beta_{s-m+3}'}{\beta_{s-m+2}''}-d_{m-2}\frac{\beta_{s-m+3}}{\beta_{s-m+2}''} \quad \text{See (68)} \quad (r)$$

By means of the above equations we can deduce the bending moment over any support of any continuous girder under the single assumption that the *modulus of elasticity*, E, *shall be constant.*

E AND I CONSTANT.

If the moment of inertia as well as the modulus of elasticity is constant our equations will be much more simple.

By inspection, we see that (a) equals zero, and hence F_r, F_r' and F_r'' equal zero and also H_r and H_r'; hence X_r' and X_{r-1}'' equal zero. By reduction we obtain

$$M_m=\frac{-c_m}{d_{s+1}\ l_1}\sum_{r=s}^{r=m}\left\{(A_r+Y_r)\ d_{s-r+2}+B_r\ d_{s-r+1}\right\}$$

$$+\frac{-d_{s-m+2}}{c_{s+1}\ l_s}\sum_{r=m-1}^{r=1}\left\{(A_r+Y_r)\ c_r+B_r\ c_{r+1}\right\} \quad (A_1)$$

$c_1 = o. \quad c_2 = 1.$

$$c_m = -2\, c_{m-1} \frac{l_{m-2} + l_{m-1}}{l_{m-1}} - c_{m-2} \frac{l_{m-2}}{l_{m-1}} \quad \ldots\ldots\ldots\ldots (p_1)$$

$d_1 = o. \quad d_2 = 1.$

$$d_m = -2\, d_{m-1} \frac{l_{s-m+3} + l_{s-m+2}}{l_{s-m+2}} - d_{m-2} \frac{l_{s-m+3}}{l_{s-m+2}} \quad \ldots\ldots\ldots\ldots (r_1)$$

$$Y_r = -6\, E\, I \left\{ \frac{h_r - h_{r-1}}{l_{r-1}} + \frac{h_r - h_{r+1}}{l_r} \right\} \quad \ldots\ldots\ldots\ldots (l_1)$$

A_r

Concentrated loads—

$$A_r = -\Sigma\, P_r\, l_r^2\, (2\, k_r - 3\, k_r^2 + k_r^3) \quad \ldots\ldots\ldots\ldots (i_1)$$

Partial uniform load—

$$A_r = -w_r\, l_r^3 \left\{ k_r^2 - k_r^3 + \frac{k_r^4}{4} \right\} \begin{matrix} a_r' = k_r\, l_r \\ a_r'' = k_r\, l_r \end{matrix} \quad \ldots\ldots\ldots\ldots (86)$$

Uniform load over all—

$$A_r = -\frac{1}{4} w_r\, l_r^2 \quad \ldots\ldots\ldots\ldots (87)$$

B_r

Concentrated loads—

$$B_r = -\Sigma\, P_r\, l_r^2\, (k_r - k_r^2) \quad \ldots\ldots\ldots\ldots (j_1)$$

Partial uniform load—

$$B_r = -w_r\, l_r^3 \left\{ \frac{2\, k_r^2 - k_r^4}{4} \right\} \begin{matrix} a_r' = k_r\, l_r \\ a_r'' = k_r\, l_r \end{matrix} \quad \ldots\ldots\ldots\ldots (88)$$

Uniform load over all—

$$B_r = -\frac{1}{4} w_r\, l_r^2 \quad \ldots\ldots\ldots\ldots (89)$$

E AND I CONSTANT—Spans equal.

If the spans are equal, the equations of the last case reduce to,

$$M_m = \frac{-c_m}{d_{s+1}\, l} \sum_{r=s}^{r=m} \left\{ (A_r + Y_r)\, d_{s-r+2} + B_r\, d_{s-r+1} \right\}$$

$$+ \frac{-d_{s-m+2}}{c_{s+1}\, l} \sum_{r=m-1}^{r=1} \left\{ (A_r + Y_r)\, c_r + B_r\, c_{r+1} \right\} \quad \ldots \quad (A_2)$$

$c_1 = o. \quad c_2 = 1.$

$$c_m = -4\, c_{m-1} - c_{m-2} \quad \ldots \quad (p_2)$$

$d_1 = o. \quad d_2 = 1.$

$$d_m = -4\, d_{m-1} - d_{m-2} \quad \ldots \quad (r_2)$$

A_r

Concentrated loads—

$$A_r = -\Sigma\, P_r\, l^2\, (2\, k_r - 3\, k_r^2 + k_r^3) \quad \ldots \quad (i_2)$$

Partial uniform load—

$$A_r = -\, w_r\, l^3 \left\{ k_r^2 - k_r^3 + \frac{k_r^4}{4} \right\} \begin{matrix} a'_r = k_r\, l \\ a''_r = k_r\, l \end{matrix} \quad \ldots \quad (90)$$

Uniform load over all—

$$A_r = -\frac{1}{4}\, w_r\, l^3 \quad \ldots \quad (91)$$

B_r

Concentrated loads—

$$B_r = -\Sigma\, P_r\, l^2\, (k_r - k_r^3) \quad \ldots \quad (j_2)$$

Partial uniform load—

$$B_r = -\, w_r\, l^3 \left\{ \frac{2\, k_r^2 - k_r^4}{4} \right\} \begin{matrix} a'_r = k_r\, l \\ a''_r = k_r\, l \end{matrix} \quad \ldots \quad (92)$$

Uniform load over all—

$$B_r = -\frac{1}{4} w_r l^3 \quad \ldots \ldots \ldots \ldots \ldots \ldots \quad (93)$$

$$Y_r = -6 E I \left\{ \frac{2 h_r - h_{r-1} - h_{r+1}}{l} \right\} \quad \ldots \ldots \ldots \quad (l_2)$$

In case the supports are at the same level, $Y_r = o$ in all equations.

From (p_2) and (r_2) we obtain the following values for c and d:

$c_1 = \pm \quad 0 = d_1$	$c_7 = - \quad 780 = d_7$
$c_2 = + \quad 1 = d_2$	$c_8 = + \quad 2911 = d_8$
$c_3 = - \quad 4 = d_3$	$c_9 = - \quad 10864 = d_9$
$c_4 = + \quad 15 = d_4$	$c_{10} = + \quad 40545 = d_{10}$
$c_5 = - \quad 56 = d_5$	$c_{11} = - \quad 151316 = d_{11}$
$c_6 = + \quad 209 = d_6$	$c_{12} = + \quad 564719 = d_{12}$

Explanation of Table I — In the co-efficients $(2 k_r - 3 k_r^2 + k_r^3)$ and $(k_r - k_r^3)$, k_r is a fraction and equals $\frac{a_r}{l_r}$, hence, it is immaterial about the actual values of a and l as long as the *ratio* is known.

The ratio k_r has been assumed to have all possible values from ***.001*** to ***.999*** inclusive, and the respective values of the above co efficients, carefully computed, are given in Table I. A few trials will prove the great utility of this table, and convince the computer that much time and labor can be saved by its use.

SHEAR.

The moments over the supports being determined, the shears can be found from the following formulas, which apply to *all cases.*

$$S_r = \frac{M_{r+1} - M_r}{l_r} + Q_r \quad \ldots \ldots \ldots \text{See (10)} \ldots \ldots (B)$$

$$S'_r = \frac{M_{r-1} - M_r}{l_{r-1}} + Q'_{r-1} \quad \text{See (11)} \quad (C)$$

In which Q and Q' have the following values:

Concentrated loads—

$$Q_r = \Sigma P_r (1 - k_r) \quad (94)$$

$$Q'_r = \Sigma P_r k_r \quad (95)$$

Partial uniform load—

$$Q_r = w_r l_r \left\{ \frac{\Sigma k_r - k_r^2}{2} \right\} \quad \begin{matrix} a'_r = k_r l_r \\ a''_r = k_r l_r \end{matrix} \quad (96)$$

$$Q'_r = w_r l_r \left\{ \frac{k_r^2}{2} \right\} \quad \begin{matrix} a'_r = k_r l_r \\ a''_r = k_r l_r \end{matrix} \quad (97)$$

Uniform load over all—

$$Q_r = \frac{1}{2} w_r l_r \quad (98)$$

$$Q'_r = \frac{1}{2} w_r l_r \quad (99)$$

INTERMEDIATE BENDING MOMENTS.

General equations for *all possible cases.*

$$M'_x = M_r + S_r x_r - L_r \quad \text{See (8)} \quad (D)$$

In which L has the following values:

Concentrated loads—

$$L_r = \Sigma P_r (x_r - a_r) \quad a_r \leq x_r \quad (100)$$

Partial uniform loads—

$$L_r = w_r \left\{ a_r \left(x_r - \frac{a_r}{2} \right) \right\} \quad \begin{matrix} a_r = a'_r \\ \cdots \\ a_r = a''_r \end{matrix} \quad a'_r \leq x_r \quad (101)$$

$$L_r = w_r \left\{ a_r \left(x_r - \frac{a_r}{2} \right) \right\} \quad \begin{matrix} a_r = a'_r = x_r \\ \cdots \\ a'_r = a''_r = 0 \end{matrix} = \frac{1}{2} w_r x_r^2 \quad (102)$$

DEFLECTION.

General formula. ***E*** alone constant.

$$y_r = h_r + t_r\, x_r + \frac{1}{6\,E\,\overset{r}{I}_x}\left\{ 3\,M_r\,x_r^2 + S_r\,x_r^3 - \Sigma\,P_r(x_r-a_r)^3 \right\}$$

$$+ \frac{1}{6\,E\,\overset{r}{I}_x}\sum_{v=x_r}^{v=l}\left(\frac{\overset{r}{I}_x}{\overset{r}{I}_{v-1}} - \frac{\overset{r}{I}_x}{\overset{r}{I}_v}\right)\left\{3\,M_r\,e_v\,(2\,x_r - e_v) + S_r\,e_v^2\,(3\,x_r - 2\,e_v)\right.$$

$$\left. - \Sigma\,P_r\,(e_v-a_r)^3 - 3\,(x_r-e_v)\,\Sigma\,P_r\,(e_v-a_r)^2\right\} \quad \text{. See (39) . . } (E)$$

$$t_{r+1} = \frac{h_{r+1}-h_r}{l_r} + \frac{1}{6\,E\,\overset{r}{I}_l}\left\{ M_r\,l_r + 2\,M_{r+1}\,l_r + \Sigma\,P_r\,l_r^2\,(k_r - k_r^2) \right\}$$

$$+ \frac{1}{6\,E\,\overset{r}{I}_l\,l_r}\sum_{v=l_r}^{v=l}\left(\frac{\overset{r}{I}_l}{\overset{r}{I}_{v-1}} - \frac{\overset{r}{I}_l}{\overset{r}{I}_v}\right)\left\{ M_r\,e_v^2\,\left(3 - \frac{2\,e_v}{l_r}\right) + 2\,M_{r+1}\frac{e_v^2}{l_r}\right.$$

$$\left. + \frac{2\,e_v^3}{l_r}\,\Sigma\,P_r\,l_r\,(1-k_r) + \Sigma\,P_r\,(e_v-a_r)^3 - 3\,e_v\,\Sigma\,P_r\,(e_v-a_r)^2 \right\} \text{. .(45)}$$

For uniform loads—

$$\Sigma\,P_r = \int_{a_r=a_r''}^{a_r=a_r'} w_r\,d\,a_r = \int_{a_r''=k_r\,l_r}^{a_r'=k_r\,l_r} w_r\,l_r\,d\,k_r \quad \ldots\ldots\ldots\ldots\ldots\ldots (12)$$

Remember that in the terms containing $(x-a)$ and $(e-a)$, x and e must never be *less* than a, or rather $a \leq x$ or e.

E AND I CONSTANT.

If the moment of inertia is constant the preceding equations reduce to,

$$y_r = h_r + t_r\, x_r + \frac{1}{6\,E\,I}\left\{ 3\,M_r\,x_r^2 + S_r\,x_r^3 - \Sigma\,P_r\,(x_r-a_r)^3 \right\} \quad \ldots\ldots (E_1)$$

$$t_{r+1} = \frac{h_{r+1}-h_r}{l_r} + \frac{1}{6\,E\,I}\left\{ M_r\,l_r + 2\,M_{r+1}\,l_r + \Sigma\,P_r\,l_r^2\,(k_r - k_r^2) \right\} \ldots (45_a)$$

For uniform loads—

$$\Sigma P_r = \int_{a_r=a_r''}^{a_r=a_r'} w_r \, d\, a_r = \int_{a_r''=k_r\, l_r}^{a_r'=k_r\, l_r} w_r \, l_r \, d\, k_r \quad \ldots\ldots\ldots\ldots\ldots (12)$$

If the supports are at the same level, the terms containing h in the above equations become zero; the equations remain the same in every other particular.

We have now deduced general equations by which we can determine the bending moments, shears and deflections for any continuous girder. In the next chapters we will give numerous examples or special cases illustrating the application of the formulas.

II.

SUPPORTED GIRDERS.

CASE I.

A simple girder resting upon two supports—

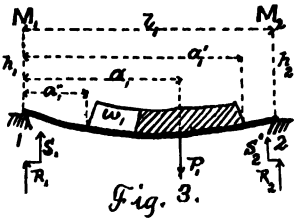

Fig. 3.

(*a*) ***E*** *alone constant.*

From (***A***) we have for M_1 and M_2

$$M_1=M_2=O \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (103)$$

From (***B***) and (***C***)

$$S_1=Q_1 \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (104)$$

$$S'_2=Q'_1 \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (105)$$

Or

$$S_1=\Sigma\, P_1\,(1-k_1) \quad \ldots \textit{for concentrated loads} \ldots\ldots (106)$$

$$S'_2=\Sigma\, P_1\, k_1 \quad \ldots \textit{for concentrated loads} \ldots\ldots\ldots (107)$$

$$S_1=w_1\, l_1 \left\{k_1-\frac{k_1^2}{2}\right\} \begin{matrix} a'_1=k_1\, l_1 \\ \ldots \\ a''_1=k_1\, l_1 \end{matrix} \textit{for any uniform load} \ldots (108)$$

$$S'_2=w_1\, l_1 \left\{\frac{k_1^2}{2}\right\} \begin{matrix} a'_1=k_1\, l_1 \\ \ldots \\ a''_1=k_1\, l_1 \end{matrix} \textit{for any uniform load} \ldots\ldots (109)$$

$$S_1=\frac{1}{2}\, w_1\, l_1 \quad \ldots \textit{for uniform load over all} \ldots\ldots\ldots (110)$$

$$S_x' = \frac{1}{2} w_1 l_1 \quad \text{. . . for uniform load over all} \quad \ldots\ldots (111)$$

From (*D*) the bending moment at any section x_1 is

$$M_x' = S_1 x_1 - L_1 \quad \ldots\ldots\ldots\ldots\ldots\ldots (112)$$

Substituting the values of S_1 and L_1 we have,

For concentrated loads—

$$M_x' = \Sigma P_1 (1-k_1) x_1 - \Sigma P_1 (x_1 - a_1) \quad \text{. . . } x \leq x \quad \ldots (113)$$

For any uniform load—

$$M_x' = x_1 w_1 l_1 \left\{ k_1 - \frac{k_1^2}{2} \right\}_{a_1''}^{a_1'} - w_1 \left\{ a_1 (x_1 - \frac{a_1}{2}) \right\}_{a_1 \leq x_1}^{a_1 = a_1'} \quad (114)$$

For uniform load over all—

$$M_x' = \frac{1}{2} w_1 l_1 x_1 - \frac{1}{2} w_1 x_1^2 = \frac{1}{2} w_1 x_1 (l_1 - x_1) \quad \ldots\ldots (115)$$

For a uniform load over all, the moment at the center of the girder becomes,

$$M_c = \frac{1}{2} w_1 \frac{l_1^2}{2} - \frac{1}{2} w_1 \frac{l_1^2}{4} = \frac{1}{8} w_1 l_1^2 \quad \ldots\ldots\ldots (116)$$

The well known formula for this case. We see, therefore, that our formulas are perfectly exact for the simple girder, and also that a variable moment of inertia or difference of level of the supports does not effect the values of the bending moments or the shears.

From (*E*), we have,

$$y_1 = h_1 + t_1 x_1 + \frac{1}{6 E I_x'} \left(S_1 x_1^3 - \Sigma P_1 (x_1 - a_1)^3 \right) + \frac{1}{6 E I_x'} \sum_{v=x_1}^{v=1} \left(\frac{I_x'}{I_{v-1}'} - \frac{I_x'}{I_v'} \right) \left\{ S_1 e_v^2 (3 x_1 - 2 e_v) - \Sigma P_1 (e_v - a_1)^3 - 3 (x_1 - e_v) \Sigma P_1 (e_v - a_1)^2 \right\} \quad (117)$$

$$t_r = \frac{h_2 - h_1}{l_1} \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (118)$$

(*b*) ***E*** *and* ***I*** *constant.*

The moment and shear equations are the same as in (*a*).

$$y_1 = h_1 + t_1 x_1 + \frac{1}{6\,E\,I}\left\{ S_1 x_1^3 - \Sigma P_1 (x_1 - a_1)^3 \right\} \quad \ldots\ldots \quad (119)$$

If the origin is taken at one of the supports, the corresponding value of h, will, of course, equal zero.

CASE II.

A beam continuous over three supports—

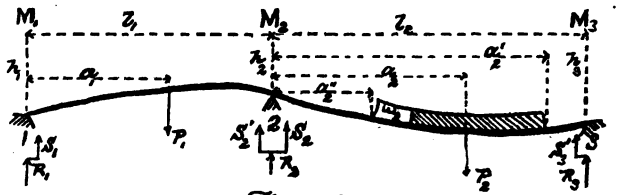

Fig. 4.

(*a*) ***E*** *alone, constant.*

From (*A*),

$$M_1 = M_3 = O \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (120)$$

$$M_2 = \frac{-c_2}{d_3\ \beta_1''}\left\{ (A_2 + Y_2 + X_2' + X_1'')\ d_2 + B_2\ d_1 \right\} + \frac{-d_2}{c_3\ \beta_2}\left\{ (A_1 + Y_1 + X_1')\ c_1 + B_1\ c_2 \right\} \quad \ldots \quad (121)$$

$$c_1 = o. \quad c_2 = 1. \quad c_3 = \frac{2\ \beta_2'}{-\beta_2} \quad \ldots\ldots\ldots\ldots\ldots \quad (122)$$

$$d_1 = o. \quad d_2 = 1. \quad d_3 = -\frac{2\ \beta_2'}{\beta_1''} \quad \ldots\ldots\ldots\ldots\ldots \quad (123)$$

Substituting (*122*) and (*123*) in (*121*), it reduces to,

$$M_2 = \frac{1}{2\,\beta_2'}\,(A_2 + Y_2 + X_2' + X_1'' + B_1) \quad \ldots\ldots\ldots\ldots \quad (124)$$

$$X_2' = H_2\,\theta_1 - F_2'\,\Sigma\,P_2\,l_2\,(1-k_2)\,\theta_1 \quad \ldots\ldots\ldots\ldots (125)$$

$$X_1'' = -H_1'\,\theta_2 - 2\,F_1''\,\Sigma\,P_1\,l_1\,(1-k_1)\,\theta_2 \quad \ldots\ldots\ldots (126)$$

$$H_2 = \sum_{v=l_2}^{v=1} \overset{2}{\triangle}_v \left\{ \frac{\Sigma\,P_2\,(e_v-a_2)^3}{l_2} + \frac{3\,(l_2-e_v)}{l_2}\,\Sigma\,P_2\,(e_v-a_2)^2 \right\} \quad \ldots (127)$$

$$H_1' = \sum_{v=l_1}^{v=1} \overset{1}{\triangle}_v \left\{ \frac{\Sigma\,P_1\,(e_v-a_1)^3}{l_1} - \frac{3\,e_v}{l_1}\,\Sigma\,P_1\,(e_v-a_1)^2 \right\} \quad \ldots (128)$$

$$\overset{2}{\triangle}_v = \frac{\overset{2}{I}_1}{\overset{2}{I}_{v-1}} - \frac{\overset{2}{I}_1}{\overset{2}{I}_v} \quad \ldots\ldots\ldots\ldots\ldots\ldots (129)$$

$$\overset{1}{\triangle}_v = \frac{\overset{1}{I}_1}{\overset{1}{I}_{v-1}} - \frac{\overset{1}{I}_1}{\overset{1}{I}_v} \quad \ldots\ldots\ldots\ldots\ldots\ldots (130)$$

$$F_2' = \sum_{v=l_2}^{v=1} \overset{2}{\triangle}_v e_v^2 \left\{ \frac{3}{l_2} - \frac{2\,e_v}{l_2^2} \right\} \quad \ldots\ldots\ldots\ldots (131)$$

$$F_1'' = \sum_{v=l_1}^{v=1} \overset{1}{\triangle}_v \frac{e_v^3}{l_1^2} \quad \ldots\ldots\ldots\ldots\ldots\ldots (132)$$

$$F_2 = \sum_{v=l_2}^{v=1} \overset{2}{\triangle}_v \left\{ \frac{l_2^3-(l_2-e_v)^3}{l_2^3} \right\} \quad \ldots\ldots\ldots\ldots (133)$$

$$\beta_2' = 6\,E\,\overset{2}{I}_1\,(l_1+F_1'') + 6\,E\,\overset{1}{I}_1\,(l_2+F_2) \quad \ldots\ldots\ldots (133_a)$$

$$Y_2 = -3\,6\,E^2\,\overset{2}{I}_1\,\overset{1}{I}_1 \left\{ \frac{h_2-h_1}{l_1} + \frac{h_2-h_3}{l_2} \right\} \quad \ldots\ldots (134)$$

A_2 and B_1

Concentrated loads—

$$A_2 = -\Sigma P_2 l_2^2 (2 k_2 - 3 k_2^2 + k_2^3) 6 E I_1' \quad \ldots\ldots\ldots (135)$$

$$B_1 = -\Sigma P_1 l_1^2 (k_1 - k_1^3) 6 E I_1^2 \quad \ldots\ldots\ldots (136)$$

Partial uniform loads—

$$A_2 = -w_2 l_2^3 \left\{ k_2^2 - k_2^3 + \frac{k_2^4}{4} \right\}_{a_2'' = k_2 l_2}^{a_2' = k_2 l_2} 6 E I_1' \quad \ldots\ldots\ldots (137)$$

$$B_1 = -w_1 l_1^3 \left\{ \frac{2 k_1^3 - k_1^4}{4} \right\}_{a_1'' = k_1 l_1}^{a_1' = k_1 l_1} 6 E I_1^2 \quad \ldots\ldots\ldots (138)$$

Uniform load over all—

$$A_2 = -\frac{1}{4} w_2 l_2^3 6 E I_1' \quad \ldots\ldots\ldots (139)$$

$$B_1 = -\frac{1}{4} w_1 l_1^3 6 E I_1^2 \quad \ldots\ldots\ldots (140)$$

$$\Sigma P_r = \int_{a_r = a_r''}^{a_r = a_r'} w_r \, d a_r = \int_{a_r'' = k_r l_r}^{a_r' = k_r l_r} w_r l_r \, d k_r \quad \ldots\ldots\ldots (12)$$

Shears and intermediate bending moments—

For shears and the intermediate bending moments, apply the general equations (***B***) (***c***) and (***D***), and for deflection use equations (***E***) and (***45***).

(*b*) ***E*** *and* ***I*** *constant.*

In this case, we have from the equations under (***a***),

$$M_1 = M_3 = o \quad \ldots\ldots\ldots (141)$$

$$M_2 = \frac{Y_2 + A_2 + B_1}{2\,(l_1 + l_2)} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots (142)$$

In which,

$$Y_2 = -\,6\,E\,I\left\{\frac{h_2 - h_1}{l_1} + \frac{h_2 - h_3}{l_2}\right\} \quad \ldots\ldots\ldots\ldots (143)$$

A_2 and B_1

Concentrated loads—

$$A_2 = -\,\Sigma\,P_2\,l_2^3\,(2\,k_2 - 3\,k_2^2 + k_2^3) \quad \ldots\ldots\ldots\ldots (144)$$

$$B_1 = -\,\Sigma\,P_1\,l_1^2\,(k_1 - k_1^3) \quad \ldots\ldots\ldots\ldots (145)$$

Uniform load over all—

$$A_2 = -\,w_2\,l_2^3\left\{k_2^2 - k_2^3 + \frac{k_2^4}{4}\right\}\begin{matrix} a_2' = k_2\,l_2 \\ a_2'' = k_2\,l_2 \end{matrix} \quad \ldots\ldots\ldots\ldots (146)$$

$$B_1 = -\,w_1\,l_1^3\left\{\frac{2\,k_1^2 - k_1^4}{4}\right\}\begin{matrix} a_1' = k_1\,l_1 \\ a_1'' = k_1\,l_1 \end{matrix} \quad \ldots\ldots\ldots\ldots (147)$$

Uniform load over all—

$$A_2 = -\,\frac{1}{4}\,w_2\,l_2^3 \quad \ldots\ldots\ldots\ldots (148)$$

$$B_1 = -\,\frac{1}{4}\,w_1\,l_1^3 \quad \ldots\ldots\ldots\ldots (149)$$

As this is a case much used in practice, we will give expressions for the bending moments in terms of the spans and the loads.

Concentrated loads—

$$M_2 = \frac{Y_2 - \Sigma\,P_2\,l_2^2\,K_2 - \Sigma\,P_1\,l_1^2\,K_1'}{2\,(l_1 + l_2)} \quad \ldots\ldots\ldots\ldots (150)$$

In which,

$$K_2 = 2\,k_2 - 3\,k_2^2 + k_2^3 \quad \ldots\ldots\ldots\ldots (151)$$

And

$$K_1' = k_1 - k_1^3 \quad \ldots\ldots\ldots\ldots (152)$$

From (*B*) and (*C*),

$$S_1 = \frac{Y_2 - \Sigma P_2 l_2^2 K_2 - \Sigma P_1 l_1 K_1'}{2 l_1 (l_1 + l_2)} + \Sigma P_1 (1 - k_1) = R_1 \quad . \quad (153)$$

$$S_2' = \frac{-Y_2 + \Sigma P_2 l_2^2 K_2 + \Sigma P_1 l_1^2 K_1'}{2 l_1 (l_1 + l_2)} + \Sigma P_1 k_1 \quad . \quad . \quad . \quad . \quad . \quad (154)$$

$$S_2 = \frac{-Y_2 + \Sigma P_2 l_2^2 K_2 + \Sigma P_1 l_1^2 K_1'}{2 l_2 (l_1 + l_2)} + \Sigma P_2 (1 - k_2) \quad . \quad . \quad . \quad . \quad (155)$$

$$\Big\} = R_2$$

Or,

$$R_2 = \frac{-Y_2 + \Sigma P_2 l_2^2 K_2 + \Sigma P_1 l_1^2 K_1'}{2 l_1 l_2} + \Sigma P_1 k_1 + \Sigma P_2 (1 - k_2) \quad (156)$$

$$S_3' = \frac{Y_2 - \Sigma P_2 l_2^2 K_2 - \Sigma P_1 l_1^2 K_1'}{2 l_2 (l_1 + l_2)} + \Sigma P_2 k_2 = R_3 \quad . \quad . \quad . \quad . \quad (157)$$

Uniform loads over each span—

The above equations at once reduce to

$$M_2 = \frac{Y_2 - \frac{1}{4} w_2 l_2^3 - \frac{1}{4} w_1 l_1^3}{2 (l_1 + l_2)} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (158)$$

$$S_1 = \frac{Y_2 - \frac{1}{4} w_2 l_2^3 - \frac{1}{4} w_1 l_1^3}{2 l_1 (l_1 + l_2)} + \frac{1}{2} w_1 l_1 = R_1 \quad . \quad . \quad . \quad . \quad (159)$$

$$S_2' = \frac{-Y_2 + \frac{1}{4} w_2 l_2^3 + \frac{1}{4} w_1 l_1^3}{2 l_1 (l_1 + l_2)} + \frac{1}{2} w_1 l_1 \quad . \quad . \quad . \quad . \quad . \quad (160)$$

$$S_2 = \frac{-Y_2 + \frac{1}{4} w_2 l_2^3 + \frac{1}{4} w_1 l_1^3}{2 l_2 (l_1 + l_2)} + \frac{1}{2} w_2 l_2 \quad . \quad . \quad . \quad . \quad . \quad (161)$$

Or,

$$R_2 = \frac{-Y_2 + \frac{1}{4} w_2 l_2^3 + \frac{1}{4} w_1 l_1^3}{2 l_1 l_2} + \frac{1}{2} (w_1 l_1 + w_2 l_2) \quad . \quad . \quad . \quad (162)$$

$$S_3 = \frac{Y_2 - \frac{1}{4} w_2 l_2^3 - \frac{1}{4} w_1 l_1^3}{2 l_2 (l_1 + l_2)} + \frac{1}{2} w_2 l_2 = R_3 \quad \ldots \quad (163)$$

(*c*) ***E, I*** *and* ***h*** *constant.*

In this case, the formulas are the same as in case (***b***) with the term $Y_2 = O$.

(*d*) ***E, I, h*** *and* ***l*** *constant.*

Making $l_1 = l_2$, the equations of case (***b***) reduce to

Concentrated loads—

$$M_2 = \frac{-\Sigma P_2 l_2 K_2 - \Sigma P_1 l_1 K_1}{4} \quad \ldots \quad (164)$$

$$S_1 = \frac{-\Sigma P_2 K_2 - \Sigma P_1 K_1}{4} + \Sigma P_1 (1 - k_1) = R_1 \quad \ldots \quad (165)$$

$$S_2 = \frac{+\Sigma P_2 K_2 + \Sigma P_1 K_1}{4} + \Sigma P_1 k_1 \quad \ldots \quad (166)$$

$$S_2 = \frac{+\Sigma P_2 K_2 + \Sigma P_1 K_1}{4} + \Sigma P_2 (1 - k_2) \quad \ldots \quad (167)$$

$$\Big\} = R_2$$

Or,

$$R_2 = \frac{\Sigma P_2 K_2 + \Sigma P_1 K_1}{2} + \Sigma P_1 k_1 + \Sigma P_2 (1 - k_2) = R_2 \quad \ldots \quad (168)$$

$$S_2 = \frac{\Sigma P_2 K_2 - \Sigma P_1 K_1}{4} + \Sigma P_2 k_2 - R_2 \quad \ldots \quad (169)$$

***Uniform load over all*—w_1 w_2 w**

$$M_2 = \frac{1}{8} w l^2 \quad \ldots \quad (170)$$

$$S_1 = \frac{1}{8} w l + \frac{1}{2} w l - \frac{5}{8} w l = R_1 \quad \ldots \quad (171)$$

$$S_2 = \frac{1}{8} w l + \frac{1}{2} w l + \frac{5}{8} w l \quad \ldots \quad (172)$$

$$\Big\} \frac{10}{8} w l = R_2$$

$$S_3 = \frac{1}{8} w l + \frac{1}{2} w l - \frac{5}{8} w l \quad \ldots \quad (173)$$

$$S_3' = -\frac{1}{8} w l + \frac{1}{2} w l = \frac{3}{8} w l = R_3 \quad . \quad . \quad . \quad . \quad . \quad (174)$$

CASE III.

A beam continuous over four supports—

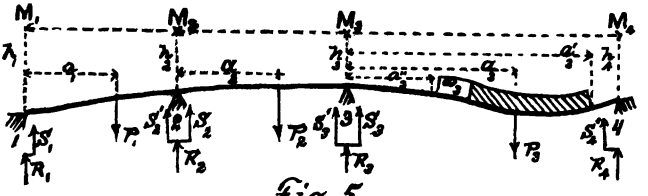

Fig. 5.

(*a*) ***E*** *alone, constant.*

$$M_1 = M_4 = 0 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (175)$$

$$M_2 = \frac{-c_2}{d_4 \beta_1''} \left\{ \begin{matrix} (A_2 + Y_2 + X_2' + X_1'') \; d_3 + B_2 \, d_2 \\ (A_3 + Y_3 + X_3' + X_2'') \; d_2 + B_3 \, d_1 \end{matrix} \right\}$$

$$+ \frac{-d_3 \beta_2''}{c_4 \beta_3 \beta_2} \left\{ (A_1 + Y_1 + X_1' + X_0'') \; c_1 + B_1 \, c_2 \right\} \quad . \quad . \quad (176)$$

Which reduces to the following:

$$M_2 = \frac{-1}{d_4 \beta_1''} \left\{ \begin{matrix} (A_2 + Y_2 + X_2' + X_1'') \; d_3 + B_2 \\ (A_3 + Y_3 + X_3' + X_2'') \end{matrix} \right\} + \frac{-d_3}{(c_4 \beta_3)} \frac{\beta_2''}{\beta_2} B_1 \; . \; . \; (177)$$

$$M_3 = \frac{-c_3 \beta_2}{(d_4 \beta_1'') \beta_2''} \left\{ (A_3 + Y_3 + X_3' + X_2'') \right\}$$

$$+ \frac{-1}{c_4 \beta_3} \left\{ \begin{matrix} + B_1 \\ (A_2 + Y_2 + X_2' + X_1'') + B_2 \, c_3 \end{matrix} \right\} \quad . \quad . \quad . \quad (178)$$

Use general equations for the various terms in the above, and also for shear, intermediate moments and deflection.

(*b*) *E and I constant.*

Our equations now reduce to

$$M_2 = \frac{(Y_2+A_2+B_1)\,2\,(l_2+l_3)-(A_3+B_2+Y_3)\,l_2}{4\,(l_1+l_2)\,(l_2+l_3)-l_2^2} \quad . \quad . \quad . \quad . \quad (179)$$

$$M_3 = \frac{(Y_3+A_3+B_2)\,2\,(l_1+l_2)-(B_1+A_2+Y_2)\,l_2}{4\,(l_1+l_2)\,(l_2+l_3)-l_2^2} \quad . \quad . \quad . \quad . \quad (180)$$

(*c*) *E, I and h constant.*

$$M_2 = \frac{2\,(l_2+l_3)\,(A_2+B_1)-l_2\,(A_3+B_2)}{4\,(l_1+l_2)\,(l_2+l_3)-l_2^2} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (181)$$

$$M_3 = \frac{2\,(l_1+l_2)\,(A_3+B_2)-l_2\,(A_2+B_1)}{4\,(l_1+l_2)\,(l_2+l_3)-l_2^2} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (182)$$

(*d*) *E, I, h and l constant.*

$$M_2 = \frac{4\,(A_2+B_1)-(A_3+B_2)}{15\,l} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (183)$$

$$M_3 = \frac{4\,(A_3+B_2)-(A_2+B_1)}{15\,l} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (184)$$

Uniform loads—

If each span is covered with a uniform load, we have

$$M_2 = \frac{-3\,w_2\,l_2^2-4\,w_1\,l_1^2+w_3\,l_3^2}{60} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (185)$$

$$M_3 = \frac{-3\,w_2\,l_2^2-4\,w_3\,l_3^2+w_1\,l_1^2}{60} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (186)$$

If $w_1=w_2=w_3=w$, and $l_1=l_2=l_3=l$, we obtain, at once, the well known forms,

$$M_2 = -\frac{1}{10}w\,l^2 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (187)$$

$$M_3 = -\frac{1}{10}w\,l^2 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (188)$$

And for the shears we have

$$S_1 = -\frac{1}{10} w\,l + \frac{1}{2} w\,l = \frac{4}{10} w\,l = R_1 \quad \ldots\ldots (189)$$

$$S_2' = +\frac{1}{10} w\,l + \frac{1}{2} w\,l = \frac{6}{10} w\,l \quad \ldots\ldots (190)$$

$$S_2 = +\frac{1}{2} w\,l = \frac{5}{10} w\,l \quad \ldots\ldots (191)$$

$$R_2 = S_1' + S_2 = \left\{\frac{6}{10} + \frac{5}{10}\right\} w\,l = \frac{11}{10} w\,l \quad \ldots\ldots (192)$$

$$S_3' = +\frac{1}{2} w\,l = \frac{5}{10} w\,l \quad \ldots\ldots (193)$$

$$S_3 = +\frac{1}{10} w\,l + \frac{1}{2} w\,l = \frac{6}{10} w\,l \quad \ldots\ldots (194)$$

$$R_3 = S_3' + S_3 = \left\{\frac{5}{10} + \frac{6}{10}\right\} w\,l = \frac{11}{10} w\,l \quad \ldots\ldots (195)$$

$$S_4' = -\frac{1}{10} w\,l + \frac{1}{2} w\,l = \frac{4}{10} w\,l = R_4 \quad \ldots\ldots (196)$$

CASE IV.

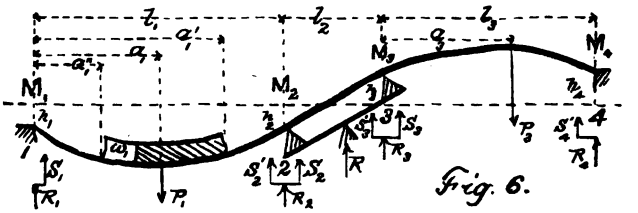
"THE TIPPER."

* We will now consider the case of the "Tipper," or a beam continuous over four supports, the second and third supports, resting on a rigid beam, supported, generally, by a single support at its center.

It is evident that if supports **2** and **3** are supported by an unyielding bar, which is supported, in turn, at its center, that the reaction R_2 must equal the reaction R_3, and also that $+h_2 = -h_3$. If the unyielding bar is not supported at its center, R_2 and R_3 will be inversely proportional to their lever arms around the point of support, and $+h_2$ and $-h_3$ will be directly proportional to the lever arms.

* See "Strains in Framed Structures," page 254, by Prof. DuBois.

The unyielding bar supported at its center—



(*a*) ***E*** *alone, constant.*

From our general equations, by reduction, we obtain,

$$R_2 = \frac{-M_2}{l_1} + \frac{M_3 - M_2}{l_2} + Q_1' + Q_2 \quad \ldots\ldots\ldots \quad (197)$$

$$R_3 = \frac{-M_3}{l_3} + \frac{M_2 - M_3}{l_2} + Q_2' + Q_3 \quad \ldots\ldots\ldots \quad (198)$$

Since $R_2 = R_3$, we have

$$\frac{M_3}{l_3} - \frac{M_2}{l_1} + \frac{2\,M_3 - 2\,M_2}{l_2} + Q_1' + Q_2 - Q_2' - Q_3 = 0 \quad \ldots \quad (199)$$

$$Q_2 - Q_2' = \Sigma\, P_2\,(1 - 2\,k_2) \quad \ldots\ldots\ldots\ldots\ldots \quad (200)$$

Let

$$Q_1' + Q_2 - Q_2' - Q_3 = Q \quad \ldots\ldots\ldots\ldots\ldots \quad (201)$$

$$l_1 = n\,l_2 \text{ and } l_3 = m\,l_2 \quad \ldots\ldots\ldots\ldots\ldots \quad (202)$$

Then (199) becomes

$$n\,M_3 - m\,M_2 + 2\,m\,n\,(M_3 - M_2) + m\,n\,Q\,l_2 = 0 \quad \ldots\ldots \quad (203)$$

Or,

$$n\,M_3 - m\,M_2 + 2\,m\,n\,(M_3 - M_2) = -\,m\,n\,Q\,l_2 \quad \ldots\ldots \quad (204)$$

By inspecting the equations under Case III, we see that the moment equations may be placed under the following forms:

$$M_2 = C_2\,Y_2 + C_3\,Y_3 + C_1 \quad \ldots\ldots\ldots\ldots\ldots \quad (205)$$

$$M_3 = C_2'\,Y_2 + C_3'\,Y_3 + C_1' \quad \ldots\ldots\ldots\ldots\ldots \quad (206)$$

From (205) and (206), we have

$$M_3-M_2=(C_2'-C_2)\ Y_2+(C_3'-C_3)\ Y_3+(C_1'-C_1) \quad . \quad . \quad . \quad . \quad (207)$$

Substituting (205), (206) and (207) in (204), it becomes

$$\left.\begin{array}{l} +n\ C_2'\ Y_2+n\ C_3'\ Y_3+n\ C_1' \\ -m\ C_2\ Y_2-m\ C_3\ Y_3-m\ C_1 \\ +2\,m\,n\,(C_2'-C_2)\ Y_2+2\,m\,n\,(C_3'-C_3)\ Y_3 \\ \qquad\qquad +2\ m\ n\ (C_1'-C_1) \end{array}\right\} = -\,m\,n\ Q\,l_2 \ . \quad (208)$$

Or, by placing V and V' in place of the co-efficients of Y, etc., we have

$$V\ Y_2+V'\ Y_3=-\,m\ n\ Q\ l_2-V'' \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (209)$$

$$\text{Now, } Y_2=-\,\theta_1\,\theta_2\left\{\frac{h_2-h_1}{n\,l_2}+\frac{h_2-h_3}{l_2}\right\} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (210)$$

$$Y_3=-\,\theta_2\,\theta_3\left\{\frac{h_3-h_2}{l_2}+\frac{h_3-h_4}{m\,l_2}\right\} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (211)$$

But, $h_2=-h_3$, or, $h_3=-h_2$; therefore,

$$V\ Y_2=-\,\theta_1\,\theta_2\left\{\frac{-h_1}{n\,l_2}V\right\}-\left\{\frac{1+2\ n}{n\ l_2}V\right\}\theta_1\,\theta_2\,h_2 \quad . \quad . \quad (212)$$

$$V'\ Y_3=-\,\theta_2\,\theta_3\left\{\frac{-h_4}{m\,l_2}V'\right\}-\left\{\frac{1+2\ m}{m\ l_2}\ V'\right\}\theta_2\,\theta_3\,h_2 \quad . \quad . \quad (213)$$

Hence,

$$V'\ Y_3+V\ Y_2=-\left[\left\{\frac{h_1}{n\,l_2}V\ \theta_1\right\}+\left\{\frac{h_4}{m\,l_2}V'\theta_3\right\}\right]\theta_2$$

$$-\left[\left\{\frac{1+2\ n}{n\ l_2}\ V\,\theta_1\right\}+\left\{\frac{1+2\ m}{m\ l_2}V'\theta_3\right\}\right]\theta_2\,h_2 \ . \ . \ (214)$$

Or,

$$V'\ Y_3+V\ Y_2=[1]\ \theta_2-[2]\ \theta_2\ h_2 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (215)$$

Therefore,

$$[1]\ \theta_2-[2]\ \theta_2\ h_2=-\,m\ n\ Q\,l_2-V'' \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (216)$$

And

$$h_2=\frac{+m\ n\ Q\ l_2+V''+[1]\ \theta_2}{[2]\ \theta_2} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (217$$

From (217), we can find the value of $h_2 = -h_3$, and then the values of Y_2 and Y_3 from (210) and (211), whence we can determine M_2 and M_3 from (177) and (178).

The easiest method of finding the values of the terms in the equation giving the value of h_2, is to substitute, for any particular case, the values of all the known quantities in the immediately preceding equations, or find the values of the constants C_1, C_2, etc., and in turn, substitute them in the equations containing them. The operations are long and exceedingly tedious, but simple, as an examination of the equations shows.

(*b*) *E and I constant.*

If the moment of inertia is constant, the deduction of the constants C_1, C_2, etc., becomes much more simple. After h_2 is determined from (217), and Y_2 and Y_3 from (210) and (211), the bending moments are readily obtained from (179) and (180).

If $h_1 = h_4 = o$, as is usually the case, the process becomes still more simple.

(*c*) *E and I constant.* $h_1 = h_4 = o$. $l_1 = l_3 = l$. $l_2 = n\ l$. $h_2 = -h_3$.

We have, as in (*a*), by a little reduction,

$$n\ (M_3 - M_2) + 2\ (M_3 - M_2) = -n\ l\ Q \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (218)$$

Or,

$$(n+2)\ (M_3 - M_2) = -n\ l\ Q \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (219)$$

Letting $4\ (l_1 + l_2)\ (l_2 + l_3) - l_2^2 = D\ l$ . . . . . (220)

We have, from (179) and (180),

$$M_2 = \frac{(Y_2 + A_2 + B_1)\ 2\ (n+1) - (A_3 + B_2 + Y_3)\ n}{D} \quad . \quad . \quad . \quad . \quad . \quad (221)$$

$$M_3 = \frac{(Y_3 + A_3 + B_2)\ 2\ (n+1) - (A_2 + B_1 + Y_2)\ n}{D} \quad . \quad . \quad . \quad . \quad . \quad (222)$$

Then,

$$D\ (M_3 - M_2) = (Y_3 + A_3 + B_2)\ 2\ (n+1) - (A_2 + B_1 + Y_2)\ n$$
$$(Y_3 + A_3 + B_2)\ n \quad - (A_2 + B_1 + Y_2)\ 2\ (n+1) \quad . \quad . \quad (223)$$

Hence,

$$Y_3(3n+2)-Y_2(3n+2)+(A_3+B_2 \\ -A_2-B_1)(3n+2)=(M_3-M_2)D \quad . \quad (224)$$

Substituting (224) in (219), it reduces to

$$(Y_3-Y_2+A_3+B_2-A_2-B_1)(3n+2)(n+2)=-DnlQ \quad . \quad (225)$$

Therefore,

$$Y_3-Y_2=\frac{-DnlQ}{(3n+2)(n+2)}-A_3-B_2+A_2+B_1 \quad . \quad (226)$$

Since $h_1=h_4=o$ and $h_2=-h_3$,

$$Y_2=-6EI\left\{\frac{h_2}{l_2}+\frac{2h_2}{l}\right\}=-6EI\left\{\frac{h_2(1+2n)}{nl}\right\} \quad . \quad (227)$$

$$Y_3=-6EI\left\{\frac{-h_2}{l}+\frac{-2h_2}{l_2}\right\}=+6EI\left\{\frac{h_2(1+2n)}{nl}\right\} \quad (228)$$

Therefore,

$$Y_3=-Y_2 \quad . \quad (229)$$

And

$$Y_3-Y_2=-2Y_2 \quad . \quad (230)$$

Hence,

$$Y_2=\frac{DnlQ}{2(3n+2)(n+2)}+\frac{A_3+B_2-A_2-B_1}{2} \quad . \quad (231)$$

But, $Dl=4(l_1+l_2)(l_2+l_3)-l_2^2=4l_1l_3+4l_2l_3 \\ +4l_2l_1+4l_2^2-l_2^2=4l^2+8nl^2+3n^2l^2-l^2(3n^2 \\ +8n+4)-l^2(3n+2)(n+2) \quad . \quad (232)$

And

$$Q=Q_1+Q_2-Q_2-Q_3 \quad . \quad (201)$$

Substituting (201) and (232) in (231), we have

$$Y_2=\frac{ll_2(Q_1+Q_2-Q_2-Q_3)}{2}+\frac{A_3+B_2-A_2-B_1}{2}-Y_3 \quad . \quad (233)$$

(233) completely determines Y_2 and Y_3, and now the bending moments can be deduced from (179) and (180).

III.

BEAMS WITH FIXED ENDS.

In this chapter we shall consider beams with one or both ends fixed.

CASE I.

A beam fixed at one end and supported at the other—

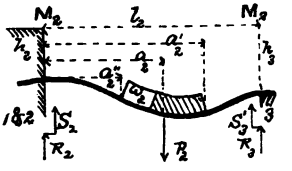


Fig. 7.

For convenience, the left end will be considered as fixed.

This case is, in reality, the same as Case II, in Chapter II, considering $l_1=o$, $h_1=h_2$ and $I_1=o$, hence, we can use the equations of that case by making the proper changes.

(*a*) ***E*** *alone constant.*

(124) becomes

$$M_2=\frac{1}{2\,\beta_2'}\,(A_2+Y_2+X_2') \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots (234)$$

(134) becomes

$$* \; Y_2 = -\, 3\,6\, E^2 \overset{2}{I}_l \overset{1}{I}_l \left\{ \frac{h_2 - h_3}{l_2} \right\} \quad \ldots\ldots\ldots\ldots \quad (235)$$

By inspecting equations (124) to (134), inclusive, it is seen that we can cancel out $\boldsymbol{6\,E\,\overset{1}{I}_l}$ from all the terms in (234), hence, we can write

$$* \; Y_2 = -\, 6\, E\, \overset{2}{I}_l \frac{h_2 - h_3}{l_2} \quad \ldots\ldots\ldots\ldots \quad (236)$$

$$\beta_2' = l_2 + F_2 \quad \ldots\ldots\ldots\ldots \quad (237)$$

$$\overset{2}{\underset{v}{\triangle}} = \frac{\overset{2}{I}_l}{\overset{2}{I}_{v-1}} - \frac{\overset{2}{I}_l}{\overset{2}{I}_v} \quad \ldots\ldots\ldots\ldots \quad (129)$$

$$F_2' = \sum_{v=l_2}^{v=1} \overset{2}{\underset{r}{\triangle}} e_r^2 \left\{ \frac{3}{l_2} - \frac{2\,e_v}{l_2^2} \right\} \quad \ldots\ldots\ldots\ldots \quad (131)$$

$$F_2 = \sum_{v=l_2}^{v=1} \overset{2}{\underset{r}{\triangle}} \left\{ \frac{l_2^3 - (l_2 - e_r)^3}{l_2^2} \right\} \quad \ldots\ldots\ldots\ldots \quad (133)$$

$$H_2 = \sum_{v=l_2}^{v=1} \overset{2}{\underset{v}{\triangle}} \left\{ \frac{\sum P_2 (e_r - a_2)^3}{l_2} + \frac{3(l_2 - e_v)}{l_2} \sum P_2 (e_r - a_2)^2 \right\} \quad \ldots(127)$$

$$X_2' = H_2 - F_2' P_2 l_2 (1 - k_2) \quad \ldots\ldots\ldots\ldots \quad (238)$$

Concentrated loads—

$$A_2 = -\sum P_2 l_2^2 (2 k_2 - 3 k_2^2 + k_2^3) \quad \ldots\ldots\ldots\ldots \quad (141)$$

---

* In reality, $\overset{1}{I}_l \left\{ \frac{h_1 - h_2}{l_1} \right\} = \overset{1}{I}_l \left\{ \frac{0_1}{0_2} \right\}$ which is indeterminate, but the above form is the only logical one which the expression for Y_2 can take.

Partial uniform loads—

$$A_2 = -\ w_2\ l_2^3 \left\{ k_2^2 - k_2^3 + \frac{k_2^4}{4} \right\} \begin{matrix} a_2' = k_2\ l_2 \\ a_2'' = k_2\ l_2 \end{matrix} \quad \ldots\ldots\ldots\ldots \quad (146)$$

Uniform load over all—

$$A_2 = -\ \frac{1}{4}\ w_2\ l_2^3 \quad \ldots\ldots\ldots\ldots \quad (148)$$

Shears and intermediate bending moments—

For shears and the intermediate bending moments, apply the general equations (***B***), (***C***) and (***D***), and for deflection, use equations (***E***) and (***45***).

(*b*) ***E*** *and* ***I*** *constant.*

For this case, (129), (131), (133), (127) and (238) become zero, and (237) reduces to

$$\beta_2' = l_2 \quad \ldots\ldots\ldots\ldots \quad (239)$$

And we have from (234) or (142)

$$M_2 = \frac{Y_2 + A_2}{2\ l_2} \quad \ldots\ldots\ldots\ldots \quad (240)$$

In which the values of Y_2 and A_2 are given by (236), (144), (146) or (148).

As this is a case quite likely to occur in practice, we will give expressions for the bending moments and shears in terms of the loads and span.

Concentrated loads—

Substituting in (144) in (240), or from (150), we have

$$M_2 = \frac{Y_2 - \Sigma\ P_2\ l_2^2\ K_2}{2\ l_2} \quad \ldots\ldots\ldots\ldots \quad (241)$$

In which $K_2 = 2\ k_2 - 3\ k_2^2 + k_2^3$.

From (***B***) and (***C***), or (155),

$$S_2 = \frac{-\ Y_2 + \Sigma\ P_2\ l_2^2\ K_2}{2\ l_2^2} + \Sigma\ P_2\ (1 - k_2) = R_2 \quad \ldots\ldots \quad (242)$$

Also, (see 157).

$$S_3' = \frac{Y_2 - \Sigma P_2 l_2^2 K_2}{2 l_2^2} + \Sigma P_2 k_2 = R_3' \quad \ldots\ldots\ldots\ldots (243)$$

Uniform load over all—

The above equations at once reduce to

$$M_2 = \frac{Y_2 - \frac{1}{4} w_2 l_2^2}{2 l_2} \quad \ldots\ldots\ldots\ldots\ldots (244)$$

$$S_2 = \frac{-Y_2 + \frac{1}{4} w_2 l_2^2}{2 l_2^2} + \frac{1}{2} w_2 l_2 = R_2 \quad \ldots\ldots\ldots (245)$$

$$S_3' = \frac{+Y_2 - \frac{1}{4} w_2 l_2^2}{2 l_2^2} + \frac{1}{2} w_2 l_2 = R_3' \quad \ldots\ldots\ldots (246)$$

(*c*) ***E, I*** *and* ***h*** *constant.*

In this case the formulas are the same as in case (*b*) with the term $Y_2 = 0$.

The formulas are:

Concentrated loads—

$$M_2 = \frac{-\Sigma P_2 l_2 K_2}{2} \quad \ldots\ldots\ldots\ldots\ldots (247)$$

$$S_2 = \frac{\Sigma P_2 K_2}{2} + P_2 (1 - k_2) = R_2 \quad \ldots\ldots\ldots\ldots (248)$$

$$S_3' = \frac{-\Sigma P_2 K_2}{2} + \Sigma P_2 k_2 = R_3' \quad \ldots\ldots\ldots\ldots (249)$$

Uniform load over all—

(244) becomes

$$M_2 = -\frac{1}{8} w_2 l_2^2 \quad \ldots\ldots\ldots\ldots\ldots (250)$$

$$S_2 = \frac{1}{8} w_2 l_2 + \frac{1}{2} w_2 l_2 = \frac{5}{8} w_2 l_2 = R_2 \quad \ldots\ldots\ldots (251)$$

$$S_3' = -\frac{1}{8} w_2 l_2 + \frac{1}{2} w_2 l_2 = \frac{3}{8} w_2 l_2 = R_3 \quad \ldots\ldots (252)$$

From (18), we have

$$M_x^2 = \frac{1}{8} w_2 (5 l_2 x_2 - l_2^2 - 4 x_2^2) \quad \ldots\ldots (253)$$

$$Max.\ M_x^2 = -\frac{1}{8} w_2 l_2^2 = M_2 \quad \ldots\ldots (254)$$

From (***E***$_1$) and (***4 5 a***), we obtain, if $h_2 = h_3 = 0$,

$$y_2 = -\frac{1}{48 E I} w_2 x_2^2 (3 l_2^2 - 5 l_2 x_2 + 2 x_2^2) \ldots x_2 = a_2' \ldots (255)$$

Special case—

A single concentrated load at the centre of the beam.

By applying Table I, (250) becomes at once

$$M_2 = -P_2 l_2\ 0.1875 = -\frac{3}{16} P_2 l_2 \quad \ldots\ldots (256)$$

$$S_2 = \frac{3}{16} P_2 + \frac{1}{2} P_2 = \frac{11}{16} P_2 = R_2 \quad \ldots\ldots (257)$$

$$S_3' = -\frac{3}{16} P_2 + \frac{1}{2} P_2 = \frac{5}{16} P_2 = R_3 \quad \ldots\ldots (258)$$

$$M_x^2 = -\frac{3}{16} P_2 l_2 + \frac{11}{16} P_2 x_2 - P_2 \left\{x_2 - \frac{1}{2} l_2\right\} \quad x_2 \geq a_2 = \frac{1}{2} l_2$$

Or,

$$M_x^2 = \frac{5}{16} P_2 (l_2 - x_2) \ldots x_2 > \frac{1}{2} l_2 \quad \ldots\ldots (259)$$

$$M_x^2 = \frac{1}{16} P_2 (11 x_2 - 3 l_2) \ldots x_2 < \frac{1}{2} l_2 \quad \ldots\ldots (260)$$

The maximum moment occurs when $x_2 = \frac{1}{2} l_2$, or,

$$Max.\ M_x^2 = \frac{5}{32} P_2 l_2 \quad \ldots\ldots (261)$$

From (E_1), if $h_2=h_3=0$,

$$y_2=\frac{1}{96\ E\ I}\ P_2\ (15\ l_2\ x_2^2-5\ x_2^3 -12\ l_2^2\ x_2+2\ l_2^3)\ .\ .\ x_2>\frac{1}{2}\ l_2\ .\ .\ (262)$$

And

$$y_2=\frac{1}{96\ E\ I}\ P_2\ x_2^2\ (11\ x_2-9\ l_2)\ .\ .\ .\ x_2<\frac{1}{2}\ l\ .\ .\ .\ .\ (263)$$

CASE II.

A beam fixed at both ends—

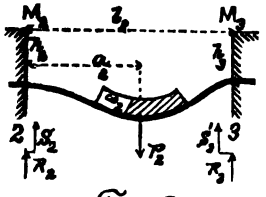

Fig. 8.

This is the same as Case II, Chapter II, with $h_1=h_2$, $h_4=h_3$, $l_1=0$, $l_3=0$, and $I_1^1=0$, and $I_1^3=0$.

(a) *E alone constant.*

From (177), we have

$$M_2=\frac{-1}{d_4\ \beta_1''}\left\{\begin{matrix}(A_2+Y_2+X_2')\ d_3+B_2\\ (\quad +Y_3+X_2'')\end{matrix}\right\}\ .\ .\ .\ .\ .\ .\ .\ .\ .\ (264)$$

From (178),

$$M_3=\frac{-c_3\ \beta_2}{(d_4\ \beta_1'')\ \beta_2''}\left\{+Y_3+X_2''\right\} + \frac{-1}{c_4\ \beta_3}\left\{(A_2+Y_2+X_2')+B_2\ c_3\right\}\ .\ .\ (265)$$

(264) reduces to

$$M_2 = \frac{-\beta_2''}{4\beta_2'\beta_3' - \beta_2\beta_2''} \left\{ \begin{matrix} (A_2 + Y_2 + X_2') \dfrac{-2\beta_3'}{\beta_2''} \\ (B_2 + Y_3 + X_2'') \end{matrix} \right\} \quad \ldots \quad (266)$$

And (178) becomes

$$M_3 = \frac{2\beta_2'}{4\beta_2'\beta_3' - \beta_2\beta_2''} \left\{ Y_3 + X_2'' \right\} + \frac{-\beta_2}{4\beta_2'\beta_3' - \beta_2\beta_2''} \left\{ (A_2 + Y_2 + X_2') + (B_2) \frac{-2\beta_2'}{\beta_2} \right\} \quad (267)$$

In which, after dividing by $\theta_1 = 0 = \theta_3$,

$$\beta_2' = l_2 + F_2 \quad \ldots \quad (268)$$

$$\beta_3' = l_2 + F_2'' \quad \ldots \quad \text{The values of } F \text{ can be found from (a) (b) (c) and (d)} \quad \ldots \quad (269)$$

$$\beta_2 = l_2 + F_2' \quad \ldots \quad (270)$$

$$\beta_2'' = l_2 + F_2' \quad \ldots \quad (271)$$

$$* \quad Y_2 = -\theta_2 \left\{ \frac{h_2 - h_3}{l_2} \right\} \quad \ldots \quad (272)$$

$$* \quad Y_3 = -\theta_2 \left\{ \frac{h_3 - h_2}{l_2} \right\} \quad \ldots \quad (273)$$

The values of the remaining terms are easily found from the general equations, remembering that θ_1 or θ_2 has been cancelled out of each term.

(*b*) *E and I constant.*

From (266) or (179), we have

$$M_2 = \frac{(Y_2 + A_2)\, 2\, l_2 - (B_2 + Y_3)\, l_2}{3\, l_2^2} = \frac{2\,(Y_2 + A_2) - (B_2 + Y_3)}{3\, l_2} \quad \ldots \quad (274)$$

From (267) or (180), we obtain

$$M_3 = \frac{(Y_3 + B_2)\, 2\, l_2 - (A_2 + Y_2)\, l_2}{3\, l_2^2} = \frac{2\,(Y_3 + B_2) - (A_2 + Y_2)}{3\, l_2} \quad \ldots \quad (275)$$

In which the terms have the values given under (*a*).

* See note under Equation (235).

(*c*) ***E, I*** *and* ***h*** *constant.*

(274) becomes

$$M_2 = \frac{2\,A_2 - B_2}{3\,l_2} \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (276)$$

(275) becomes

$$M_3 = \frac{2\,B_2 - A_2}{3\,l_2} \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (277)$$

For concentrated loads we can write

$$M_2 = \frac{-2\,\Sigma P_2\,l_2\,K_2 + \Sigma P_2\,l_2\,K_2'}{3} \quad \ldots\ldots\ldots\ldots \quad (278)$$

And

$$M_3 = \frac{-2\,\Sigma P_2\,l_2\,K_2' + \Sigma P_2\,l_2\,K_2}{3} \quad \ldots\ldots\ldots\ldots \quad (279)$$

Uniform load over all—

$$M_2 = -\frac{1}{12}\,w_2\,l_2^2 - M_3 \quad \ldots\ldots\ldots\ldots\ldots \quad (280)$$

$$S_2 = \frac{1}{2}\,l_2\,w_2 - S_3' \quad \ldots\ldots\ldots\ldots\ldots \quad (281)$$

$$M_x^2 = w_2\left\{\frac{l_2\,x_2}{2} - \frac{x_2^2}{2} - \frac{l_2^2}{12}\right\} \quad \ldots\ldots\ldots\ldots \quad (282)$$

If $x = 0$

$$Max.\ M_x^2 = -\frac{1}{12}\,w_2\,l_2^2 = M_2 = M_3 \quad \ldots\ldots\ldots\ldots \quad (283)$$

If $h_2 = h_3 = 0$,

$$y_2 = \frac{-1}{24\,E\,I}\,w_2\,x_2^2\,(l_2^2 - 2\,l_2\,x_2 + x_2^2) \quad \ldots\ldots x_2 = a_2' \quad \ldots\ldots \quad (284)$$

A single load in the centre of the beam—

By using Table I, we have at once from (278) and (279),

$$M_2 = M_3 = -0.125\,P_2\,l_2 = -\frac{1}{8}\,P_2\,l_2 \quad \ldots\ldots\ldots\ldots \quad (285)$$

$$S_2 = S_3' = \frac{1}{2}\,P_2 \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (286)$$

$$M_x = \frac{1}{8} P_2 (3 l_2 - 4 x_2) \quad . \quad . \quad x_2 > a_2 = \frac{1}{2} l_2 \quad . \quad . \quad . \quad . \quad . \quad . \quad (287)$$

Also,

$$M_x = \frac{1}{8} P_2 (4 x_2 - l_2) \quad . \quad . \quad . \quad x_2 < \frac{1}{2} l_2 \quad . \quad . \quad . \quad . \quad . \quad (288)$$

If $x_2 = 0$, or $\frac{1}{2} l_2$

$$Max. \quad M_x = -\frac{1}{8} w_2 l_2, \text{ or } -\frac{1}{8} w_2 l_2 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (289)$$

$$y_2 = \frac{-1}{48 E I} P_2 (4 x_2^3 - 6 l_2^2 x_2 - 9 l_2 x_2^2 - l_2^3) \quad . \quad . \quad x_2 > a_2 = \frac{1}{2} l_2 \quad . \quad (290)$$

And

$$y_2 = \frac{-1}{48 E I} P_2 x_2^2 (3 l_2 - 4 x_2) \quad . \quad . \quad x_2 < a_2 = \frac{1}{2} l_2 \quad . \quad . \quad (291)$$

CASE III.

A beam fixed at one end, and unsupported at the other—

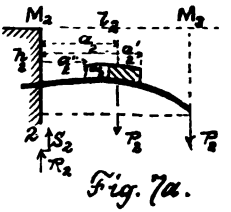

Fig. 7a.

As the right end of the beam is unsupported, there can be no reaction $S_3 = R_3$, therefore, by (11),

Concentrated loads—

$S_3 = \frac{M_2 - M_3}{l_2} + \Sigma P_2 k_2 = 0$, and since $M_3 = 0$, we have

$M_2 = - \Sigma P_2 l_2 k_2 \ldots S_2 = \Sigma P_2$ . . . . . (292)

Showing that the moment of inertia does not enter into the expression for the bending moment.

Any uniform load—

$$M_2 = -\frac{1}{2} w_2 (a_2' - a_2'')(a_2' + a_2'') \quad . . . . . (293)$$

$$S_2 = w_2 (a_2' - a_2'') \quad . . . . . (294)$$

From (8),

$M_x^2 = 0. \qquad x_2 \geqq a_2$

And

$$M_x^2 = \Sigma P_2 (x_2 - a_2) \ldots x_2 < a_2 \quad . . . . . (295)$$

Also, for any uniform load,

$$M_x^2 = w_2 (a_2' - a_2'') \left\{ x_2 - \frac{a_2' + a_2''}{2} \right\} \ldots x_2 \leqq a_2'' \quad . . . . . (296)$$

For deflection, use the general formulas, if the moment of inertia is variable.

If the moment of inertia is constant, we have, from (E_l),

If $h_2 = 0$,

$$y_2 = + \frac{1}{6 E I} \left\{ 3 M_2 x_2^2 + S_2 x_2^3 - \Sigma P_2 (x_2 - a_2)^3 \right\} \quad . . . (297)$$

Or, for a single concentrated load,

$$y_2 = \frac{P_2}{6 E I} \left\{ -3 a_2 x_2^2 + x_2^3 - (x_2 - a_2)^3 \right\} \quad . . . . . (298)$$

And if the load is at the end of the beam, $x_2 = a_2 = l_2$, and (298) becomes

$$y_2 = -\frac{P_2 l_2^3}{3 E I} \ldots \textit{at end of beam} \quad . . . . . (299)$$

Also, for a uniform load over all, ($x_2 = a_2 = l_2$),

$$y_2 = \frac{-1}{8 E I} w_2 l_2^4 \ldots \textit{at end of beam} \quad . . . . . (300)$$

CASE IV.

A beam on two supports, and one end unsupported—

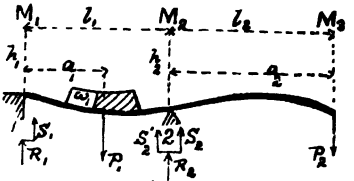

Fig. 78.

In this case, M_1, M_3 and S_3 equal zero, hence, from (**11**), or (**C**), we have

$$S_3' = \frac{M_2}{l_2} + Q_2' = 0, \text{ or, } M_2 = -Q_2' l_2 \quad \ldots\ldots\ldots (301)$$

Which is precisely the same equation we obtained in Case III. The values of Q_2' are given in (95), (97) and (99).

From the general equations (**B**) and (**C**), we obtain

$$S_1 = \frac{M_2}{l_1} + Q_1 = R_1 \quad \ldots\ldots\ldots\ldots\ldots\ldots (302)$$

$$\left.\begin{aligned} S_2' &= \frac{-M_2}{l_1} + Q_1' \quad \ldots\ldots\ldots\ldots\ldots\ldots (303) \\ S_2 &= \frac{-M_2}{l_2} + Q_2 \quad \ldots\ldots\ldots\ldots\ldots\ldots (304) \end{aligned}\right\} = R_2$$

From (**D**), we obtain

$$M_x' = S_1 x_1 - L_1 = \frac{M_2 x_1}{l_1} + Q_1 x_1 - L_1 \quad \ldots\ldots\ldots (305)$$

$$M_x'' = M_2 + S_2 x_2 - L_2 = M_2 + \frac{-M_2 x_2}{l_2} + Q_2 x_2 - L_2 \quad \ldots\ldots (306)$$

Note that the moment of inertia does not appear in any of the above equations.

For deflection, use the *general equation* (**E**).

CASE V.

A beam on one support, having one end fixed, and the other unsupported—

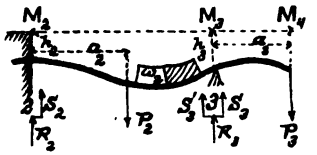

Fig. 8a.

(*a*) ***E** alone, constant.*

In this case, as before, $M_4=0$, and $S_4'=0$, hence,

$$M_3 = -\,Q_3'\,l_3 \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (307)$$

From (63), we have

$$M_2\,\beta_2 + 2\,M_3'\,\beta_3' = A_3 + B_2 + Y_3 + X_3' + X_2'' \quad \ldots\ldots\ldots \quad (308)$$

Substituting (307) in (308), it becomes, after reduction,

$$M_2 = \frac{1}{\beta_2}\left\{2\,Q_3'\,l_3\,\beta_3' + A_3 + Y_3 + X_3' + B_2 + X_2''\right\} \quad \ldots\ldots \quad (309)$$

(*b*) ***E** and **I** constant.*

(309) becomes

$$M_2 = \frac{1}{l_2}\left\{2\,Q_3'\,l_3\,(l_2+l_3) + Y_3 + A_3 + B_2\right\} \quad \ldots\ldots\ldots \quad (310)$$

$$M_3 = -\,Q_3'\,l_3 \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (307)$$

(*c*) ***E**, **I** and **h** constant.*

$$M_2 = \frac{1}{l_2}\left\{2\,Q_3'\,l_3\,(l_2+l_3) + A_3 + B_2\right\} \quad \ldots\ldots\ldots\ldots \quad (311)$$

$$M_3 = -\,Q_3'\,l_3 \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (307)$$

The shears, intermediate bending moments and deflections are readily obtained from the general equations.

CASE VI.

A beam on two supports, having neither end supported—

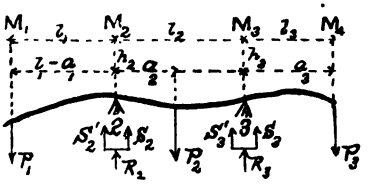

Fig. 87.

We have, at once, M_1 and M_4 equal zero, and hence, from (***B***),

$$S_1 = \frac{M_2}{l_1} + Q_1 = 0, \text{ or } M_2 = -Q_1 l_1 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (312)$$

And, from (***C***),

$$S_4' = 0 = \frac{M_3}{l_3} + Q_3', \text{ or } M_3 = -Q_3' l_3 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (313)$$

The shears, intermediate bending moments and deflections can now be readily obtained from the general equations.

IV.

* THE POINT OF ZERO MOMENT.

Let us take (***D***).

$$\overset{r}{M}_x = M_r + S_r x_r - L_r \quad \ldots \ldots \ldots \ldots \ldots \ldots \ldots \quad (D)$$

In which L is dependent upon the kind of loading in the span r. If there is no load in the span r, then

$$\overset{r}{M}_x = M_r + S_r x_r \quad \ldots \ldots \ldots \ldots \ldots \ldots \ldots \quad (314)$$

Now, if there is a point of zero moment anywhere in the span r, we can find its distance from the left support by making (314) equal zero, and solving for x_r; doing this, we obtain

$$x_r = \frac{-M_r}{S_r} \quad \ldots \ldots \ldots \ldots \ldots \ldots \ldots \quad (315)$$

From (***B***),

$$S_r = \frac{M_{r+1} - M_r}{l_r} + (Q_r \text{ in this case} = 0) \quad \ldots \ldots \ldots \quad (B)$$

Now,

$$M_m = c_m \frac{\beta_2 \beta_3 \ldots \beta_{m-1}}{\beta''_2 \beta''_3 \ldots \beta''_{m-1}} M_2 \ldots \ldots m < r+1 \quad \ldots \ldots \quad (70)$$

$m < r+1$ indicating that only those loads upon the right of the span are considered.

Substituting (***B***) and (70) in (315), it reduces to

$$x_r = \frac{c_r}{c_r - c_{r+1} \frac{\beta_r}{\beta''_r}} l_r \quad \ldots \text{ Load on the Right} \quad \ldots \ldots \ldots \quad (316)$$

---

* See "Annales des Ponts et Chaussées," 1886, Paper No. 40, by M. Collignon.

We also have, for loads on the left,

$$M_m = d_{s-m+2}\,\frac{\beta''_{s-1}\,\beta''_{s-2}\,\ldots\,\beta''_m}{\beta_{s-1}\,\beta_{s-2}\,\ldots\,\beta_m}\,M_s \quad \ldots\ldots\ldots\ldots \quad (71)$$

And, substituting (71) and (*B*) in (315), we obtain

$$x_r = \frac{d_{s-r+2}}{d_{s-r+2} - d_{s-r+1}\,\dfrac{\beta''_{r+1}}{\beta_{r+1}}}\,l_r \quad \ldots \text{ LOAD ON THE LEFT} \quad \ldots\ldots \quad (317)$$

(316) and (317) are general equations. Knowing the points of zero moment, we can tell at once what loads must be considered to have a certain effect.

The values of x_r are very easily computed, but they can be constructed graphically as soon as c_r, c_{r-1}, etc., are known. Thus:—

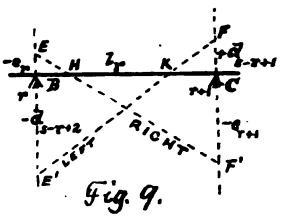

Fig. 9.

Let *B C* represent any unloaded span. Then, $B\,H = x_r$ for $m < r+1$ or a load on the right, and $B\,K = x_r$ for $m > r$ or a load on the left, if $E\,B = c_r$, $C\,F' = -c_{r+1}\,\dfrac{\beta_r}{\beta''_r}$ $F\,C = d_{s-r+1}\,\dfrac{\beta''_{r+1}}{\beta_{r+1}}$ and $B\,E' = -d_{s-r+2}$.

For, from Fig. 9,

$$B\,H = B\,C\,\frac{E\,B}{E\,B + F'\,C} = \frac{c_r}{c_r + c_{r+1}\,\dfrac{\beta_r}{\beta''_r}}\,l_r = x_r \quad \ldots \; m < r-1$$

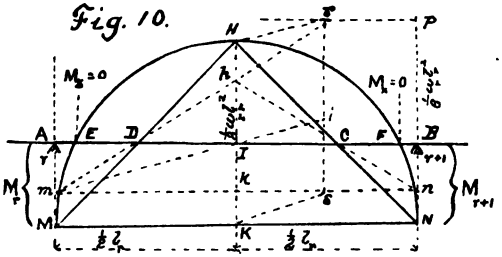
Also,

$$B\ K = B\ C\ \frac{B\ E}{B\ E + C\ F} = \frac{d_{s-r+2}}{d_{s-r+2} - d_{s-r+1}\ \frac{\beta''_{r+1}}{\beta_{r+1}}}\ l_r = x_r \quad . \quad . \quad m > r$$

If the span considered is loaded, then the value of x_r must be obtained from (D).

If the supports are level, and the span considered is uniformly loaded, x_r, and also the bending moments, can be found graphically.

Fig. 10.



Considering the span r as discontinuous and uniformly loaded, the bending moment at the centre equals $\frac{1}{8}\ w_r\ l_r^2$. Now, in Fig. 10, we wish to draw the moment parabola, so that $A\ M = M_r$ and $B\ N = M_{r+1}$. We know $H\ K$ must equal $\frac{1}{8}\ w_r\ l_r^2$. Let D and C be the points of zero moment for loads on the right and left of the span r. On the vertical $H\ K$ take any point h and draw $h\ D\ m$ and $h\ C\ n$, and connect m and n. Make $n\ p = \frac{1}{8}\ w_r\ l_r^2$ and draw $p\ r$ parallel to $m\ n$ until it is intersected by $m\ h$, produced in the point r. Draw $r\ H$ and $s\ K$ parallel to $I\ i$, and also $M\ N$ parallel to $m\ n$. Then is $H\ K = \frac{1}{8}\ w_r\ l_r^2$, $A\ M = M_r$, $B\ N = M_{r+1}$ and $A\ E$ and $A\ F = x_r$.

The co-efficients c and d.

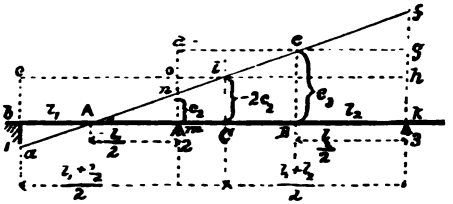


Fig. 11.

The co-efficients c and d can be found graphically, if I is considered as constant.

In Fig. 11, let $b\ m$ and $m\ k$ represent the first and second spans of a continuous girder. Bisect $b\ m$ at A, $m\ k$ at B, and $b\ k$ at C. Make $C\ l = -2\ c_2 = -2$ and draw $a\ A\ l\ e\ f$, a right line passing through A and l, then will $B\ e$ equal, numerically, c_3. Thus:—

$b\ c\ h\ k = -2\ c_2\ (l_1 + l_2) = -2\ (l_1 - l_2)$,

but $b\ c\ h\ k = f\ A\ k - a\ b\ A = f\ n\ m\ k$,

since $d\ e\ n = f\ e\ g$, $f\ n\ m\ k = g\ d\ m\ k = l_2\ (B\ e)$,

Therefore, $B\ e = -2\ \dfrac{l_1 + l_2}{l_2} = c_3$.

d_3 is found in a similar manner from Fig. 12.

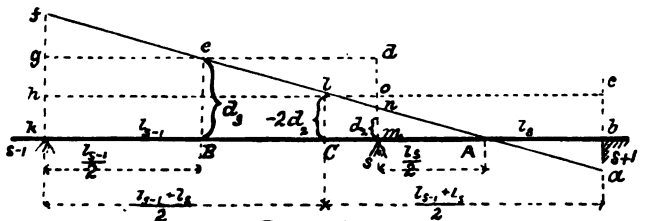

Fig. 12.

$k\ B = \dfrac{l_{s-1}}{2}$, $b\ A = \dfrac{l_s}{2}$, $k\ C = \dfrac{l_{s-1} + l_s}{2}$, $C\ l = -2\ d_2 = -2$.

$b\ c\ h\ k = -2\ d_2\ (l_s + l_{s-1}) = -2\ (l_s + l_{s-1})$,

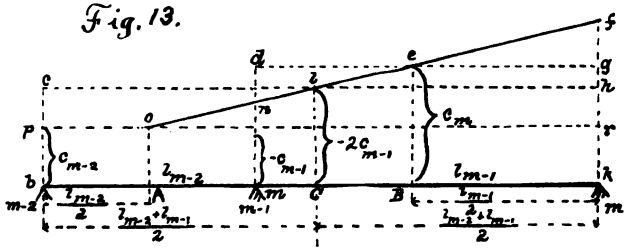
$k\ g\ d\ m = (B\ e)\ l_{s-1}$, but $b\ c\ h\ k = k\ g\ d\ m$,

Therefore,

$$B\ e = -2\ \frac{l_s + l_{s-1}}{l_{s-1}} = d_3.$$

Then, in general, from Fig. 13, we have, if

Fig. 13.



$p\ b = c_{m-2}$ and $l\ C = -2\ c_{m-1}$,

$c\ b\ k\ h = d\ g\ r\ d' + p\ r\ k\ b = d\ g\ k\ m + p\ d'\ m\ b$,

but, $g\ d\ m\ k = (B\ e)\ l_{m-1}$, $p\ d'\ m\ b = c_{m-2}\ l_{m-2}$

and $c\ b\ k\ h = -2\ c_{m-1}\ (l_{m-1} + l_{m-2})$.

UNIVERSITY CALIFORNIA.

Therefore,

$$B\ e = -2\ c_{m-1}\ \frac{l_{m-1} + l_{m-2}}{l_{m-2}} - c_{m-2}\ \frac{l_{m-2}}{l_{m-1}} = c_m.$$

And for d_m we can write

$$B\ e = -2\ d_{m-1}\ \frac{l_{s-m+2} + l_{s-m+3}}{l_{s-m+2}} - d_{m-2}\ \frac{l_{s-m+3}}{l_{s-m+2}} = d_m.$$

V.

APPLICATIONS.

We will now give a complete analysis of a continuous girder, to illustrate, more particularly, the use of Table I.

Ex. 1.—Let Fig. 14 represent a continuous girder of three spans on level supports, and having a constant moment of inertia.

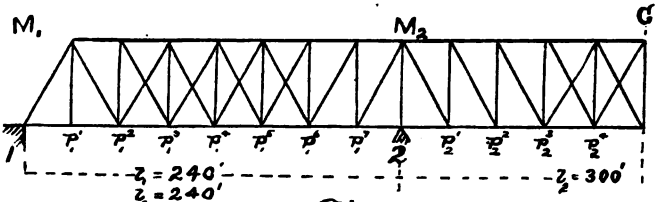


Fig. 14.

Let each panel be $30'$ in length and the loads represented as in the figure. Then $s=3$, $r=1, 2, 3$ and 4, $m=1, 2, 3$ and 4, $l_1=240'=l_3$ and $l_2=300'$.

First, look up in Table I, the values of the co-efficients $2k-3k^2+k^3$ and $k-k_3$, for the different values of $\frac{a}{l}=k$.

$k_1=k_3$	$2k_1-3k_1^2+k_1^3$	$k_1-k_1^3$	k_2	$2k_2-3k_2^2+k_2^3$	$k_2-k_2^3$
			0.100	0.171	0.099
			0.200	0 288	0.192
0.125	0.205,078,125	0.123,046,875	0.300	0.357	0.273
0.250	0.328,125,000	0.234,375,000	0.400	0.384	0.336
0.375	0.380,859,375	0.322,265,625	0.500	0.375	0.375
0.500	0.375,000,000	0.375,000,000	0.600	0.336	0 384
0.625	0.322,265,625	0.380,859,375	0.700	0.273	0.357
0.750	0,234,375,000	0.328,125,000	0.800	0.192	0.288
0.875	0.123,046,875	0.205,078,125	0.900	0.099	0.171

From (A_1), we have $M_1=0=M_4$.

$$M_2 = \frac{-c_2}{d_4\, l_1}\left\{\begin{matrix} A_2\, d_3+B_1\, d_2 \\ A_3\, d_2+B_3\, d_1 \end{matrix}\right\} + \frac{-d_3}{c_4\, l_3}\left\{ A_1\, c_1+B_1\, c_2 \right\}$$

$$M_3 = \frac{-c_3}{d_4\, l_1}\left\{ A_3\, d_2+B_3\, d_1 \right\} + \frac{-d_2}{c_4\, l_3}\left\{\begin{matrix} A_1\, c_1+B_1\, c_2 \\ A_2\, c_2+B_2\, c_3 \end{matrix}\right\}.$$

From (p_1) and (r_1), we find that, since $c_1=0$ and $c_2=1$, $c_3=-3.6$ and $c_4=+14.95$.

Also,

$d_1=0$ and $d_2=1$, $d_3=-3.6$ and $d_4=+14.95$.

Finding the values of A_1, A_2, B_1, B_2, etc., from (i_1) and (j_1), and substituting them, with the values of c and d above, in the moment equations, we obtain,

TABLE a—VALUES OF M_2.

$$\left.\begin{matrix} -\,P_1^1\,(0.123,046,875) \\ -\,P_1^2\,(0.234,375,000) \\ -\,P_1^3\,(0.322,265,625) \\ -\,P_1^4\,(0.375,000,000) \\ -\,P_1^5\,(0.380,859,375) \\ -\,P_1^6\,(0.328,125,000) \\ -\,P_1^7\,(0.205,078,125) \end{matrix}\right\} 57.7926 = \left\{\begin{matrix} -\,7.111,198\,P_1^1 \\ -\,13\,545,140\,P_1^2 \\ -\,18.624,568\,P_1^3 \\ -\,21.672,225\,P_1^4 \\ -\,23\,010,853\,P_1^5 \\ -\,18.963,196\,P_1^6 \\ -\,11.851,998\,P_1^7 \end{matrix}\right.$$

TABLE *a*—Continued.

VALUES OF M_3.

$$\left.\begin{array}{l} + P_1^1\ (0.123,046,875) \\ + P_1^2\ (0.234,375,000) \\ + P_1^3\ (0.322,265,625) \\ + P_1^4\ (0.375,000,000) \\ + P_1^5\ (0.380,859,375) \\ + P_1^6\ (0.328,125,000) \\ + P_1^7\ (0.205,078,125) \end{array}\right\} 16.0535 = \ldots\ldots\ldots \left\{\begin{array}{l} + 1.975,333\ P_1^1 \\ + 3.762,365\ P_1^2 \\ + 5.173,491\ P_1^3 \\ + 6.020,061\ P_1^4 \\ + 6.114,126\ P_1^5 \\ + 5.267,554\ P_1^6 \\ + 3.292,221\ P_1^7 \end{array}\right.$$

$$\left.\begin{array}{l} + P_2^1\ (0.171) \\ + P_2^2\ (0.288) \\ + P_2^3\ (0.357) \\ + P_2^4\ (0.384) \\ + P_2^5\ (0.375) \\ + P_2^6\ (0.336) \\ + P_2^7\ (0.273) \\ + P_2^8\ (0.192) \\ + P_2^9\ (0.099) \end{array}\right\} 25.0836 + 90.3010 \left\{\begin{array}{l} - P_2^1\ (0.099) \\ - P_2^2\ (0.192) \\ - P_2^3\ (0.273) \\ - P_2^4\ (0.336) \\ - P_2^5\ (0.375) \\ - P_2^6\ (0.384) \\ - P_2^7\ (0.357) \\ - P_2^8\ (0.288) \\ - P_2^9\ (0.171) \end{array}\right\} = \left\{\begin{array}{l} - 4.650,503\ P_2^1 \\ - 10.113,715\ P_2^2 \\ - 15.697,327\ P_2^3 \\ - 20.709,033\ P_2^4 \\ - 24.456,525\ P_2^5 \\ - 26.247,494\ P_2^6 \\ - 25.389,634\ P_2^7 \\ - 21.190,636\ P_2^8 \\ - 15.958,194\ P_2^9 \end{array}\right.$$

$$\left.\begin{array}{l} - P_3^1\ (0.205,078,125) \\ - P_3^2\ (0.328,125,000) \\ - P_3^3\ (0.380,859,375) \\ - P_3^4\ (0.375,000,000) \\ - P_3^5\ (0.322,265,625) \\ - P_3^6\ (0.234,375,000) \\ - P_3^7\ (0.123,046,875) \end{array}\right\} 57.7926 \ldots\ldots\ldots \left\{\begin{array}{l} - 11.851,998\ P_3^1 \\ - 18.963,196\ P_3^2 \\ - 22.010,853\ P_3^3 \\ - 21.672,225\ P_3^4 \\ - 18.624,568\ P_3^5 \\ - 13.545,140\ P_3^6 \\ - 7.111,198\ P_3^7 \end{array}\right.$$

Compare the values of M_2 and M_3, and notice that the co-efficients of P_3^7, P_3^6, etc., of M_3, are the same as the co efficients of P_1^1, P_1^2, etc., of M_2, as they should be, owing to the symmetry of the girder.

TABLE *b*.

The next step is the deduction of S from (B) and (C).

		First Span.		Second Span.		Third Span.	
		S_1	S_2'	S_2	S_3'	S_3	S_4'
First Span.	P_1^1	+0 845,370	+0.154,630	+0.030,288		−0.008,230	
	P_1^2	+0.693,562	+0.306,438	+0.057,691		−0.015,676	
	P_1^3	+0.547,397	+0.452,603	+0.079,327	Same as S_2 with−sign	−0.021,556	Same as S_3 with+sign

	P_2^4	−0.109,364	Same as S_1 with+sign	+0.618,461	+0.381,538	+0.086,287	Same as S_3 with−sign
	P_2^5	−0.101,902		+0.500,000	+0.500,000	+0.101,902	
	P_2^6	−0.086,287		+0.381,538	+0.618,461	+0.109,364	
	P_2^7	−0.065,405		+0.267,692	+0.732,307	+0.105,790	
	P_2^8	−0.042,140		+0.163,076	+0.836,923	+0.088,294	
	P_2^9	−0.019,377		+0.072,307	+0.927,692	+0.053,992	
Third Span.	P_3^1	+0.013,717		−0.050,480		+0.924,384	+0.075,616
	P_3^2	+0.021,948		−0.086,769		+0.829,014	+0.170,986
	P_3^3	+0.025,475	Same as S_1 with−sign	−0.093,749	Same as S_2 with+sign	+0.716,712	+0.283,288
	P_3^4	+0.025,083		−0.092,307		+0.590,301	+0.409,699
	P_3^5	+0.021,556		−0.079,327		+0.452,603	+0.547,397
	P_3^6	+0.015,676		−0.057,691		+0.306,438	+0.693,562
	P_3^7	+0.008,230		−0.030,288		+0.154,630	+0.845,370

The computation of the above table is very simple and easy. Thus:—

$S_1 = \frac{M_2}{l_1} + P_1\,(1-k_1)$, and numerically becomes, for loads in the first span,

$$S_1 = \left(\frac{-7.111}{240} + \frac{210}{240}\right) P_1' = +0.845\ P_1'.$$

$$S_1 = \left(\frac{-13.545}{240} + \frac{180}{240}\right) P_1^2 = +0.693\ P_1^2, \text{ etc., etc.}$$

For loads in the second and third spans, we have merely $\frac{M_2}{l_1}$, or the moment over the second support divided by the length of the first span.

$S_2 = \frac{M_3 - M_2}{l_2} + P_2\,(1 - k_2)$, for loads in the second span, and

$S_2 = \frac{M_3 - M_2}{l_2}$, for loads in the other spans.

$S_3 = \frac{-M_2}{l_3} + P_3\,(1 - k_3)$, for loads in the third span, and

$S_3 = \frac{-M_2}{l_3}$, for loads in the other spans.

It is necessary to compute only S_1, S_2 and S_3 to fill out the table of shears, since $S_1 + S_2 = 0$ or P_1, $S_2 + S_3 = 0$ or P_2, etc., but it is better to compute S_1, S_2 and S_3, as a check.

TABLE *c*—VALUES OF M_x.

SECOND SPAN.

$\overset{1}{M}_x = S_1\, x_1 - P_1\, (x_1 - a_1)$ for loads in the first span, and $\overset{1}{M}_x = S_1\, x_1$ for loads in the other spans. $\overset{3}{M}_x = S_3\, x_3 - P_3\, (x_3 - a_3)$ for loads in the third span, and $\overset{3}{M}_x = S_3\, x_3$ for loads in the other spans.

If there were no equal spans, then Table *c* would have the number of apices squared computations, making its formation tedious, if many spans were considered, but the great worth of the table, when once computed, overbalances the hard labor in its formation.

Having Table *c* before us, we can tell at once which of the apices must be loaded, to produce a certain result, in any particular chord member.

MAXIMUM MOMENTS.

Table (*c*) enables one to find the maximum bending moments for any chord piece, with comparatively little labor.

Dead load—

For the dead, or static loads, of the structure, the *maximum bending moment for any chord member is found by taking the algebraic sum of the quantities in the proper column of Table (c) (each co-efficicient is, of course, multiplied by its P).*

For example, suppose the maximum bending moment at the second panel of the first span, or, better, the second panel point of the first span, is desired: Multiply each co-efficient in column 3 of Table (*c*), by its proper *P*, and take the algebraic sum of the products.

Live load—

For the live or moving load, *the maximum negative moment at any panel point is found by taking the sum of the negative co-efficients (multiplied by their proper P's) in the proper column of Table (c), and vice versa for the maximum positive bending moment.*

For example, suppose the maximum negative bending moment at the second panel point is desired: Take the sum of the negative products in column 3 of Table (*c*). For positive moment, take the sum of the positive products.

If the *P's* are equal, the work is somewhat easier, as the co-efficients can be at once summed, and then multiplied by the common value of *P*.

The maximum bending moments over the supports are obtained in the same manner from Table (*a*).

MAXIMUM SHEAR.

The maximum shear is obtained from Table (*b*).

Dead load—

The maximum shear at any panel point is found by:

First.—*Taking the algebraic sum of the co-efficients (multiplied by their P's) of all the loads outside of the span in which the apex considered lies.*

Second.—*Considering the span in which the apex lies alone, and using for the left reactions the co-efficients as found in the column giving the values of S.*

For example, take the second apex of the first span. The maximum shear is found: First, by taking the algebraic sum of the co-efficients in column S_1 for the second and third spans. Second, by taking the sum of the co-efficients opposite P_1^2, P_1^3 to P_1^7, inclusive, and *decreasing* it by the co-efficient opposite P_1' in column S_2.

Live load—

For *positive* or *negative* shear:

First.—*Take the sum of the positive or negative co-efficients (multiplied by their P's) for spans in which the apex does not lie.*

Second.—*Consider the span in which the apex lies alone, and use for left reactions the positive or negative co-efficients (multiplied by their P's) as given in the proper column of Table (b).*

For example, find the maximum positive shear at the second apex of the first span:

First.—Take sum of co-efficients (multiplied by their *P's*) in column S_1, opposite third span.

Second.—Take sum of co efficients (multiplied by their *P's*), opposite P_1^2 to P_1^7, inclusive.

Knowing the maximum shears and bending moments, the maximum stresses are then easily obtained.

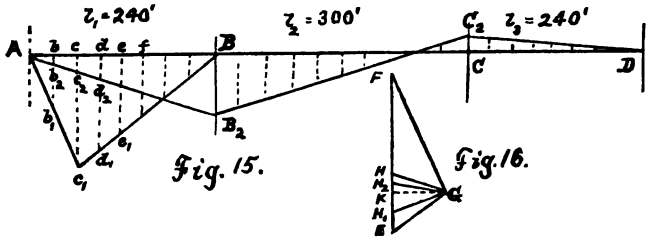

Fig. 15.

Fig. 16.

The following is a graphical solution of the same example. Tables (*b*) and (*c*) can be filled by means of graphics, as can also Table (*a*), by using *Prof. Greene's Method of Area Moments*, which is fully explained in *Part II* of *Greene's Trusses and Arches.*

Let it be supposed that Table (*a*) has been filled, either by computation or by *Greene's Method of Area Moments;* we have, then, the bending moments over the supports, or the "pier ordinates." Consider only a single concentration at the second apex of the first span, and call it P_1^2; then, if the first span were discontinuous, the moment polygon $A\ c_1\ B$ would enable us to determine the bending moments at other apices of the span; but the girder is not discontinuous, and the load P_1^2 induces a negative moment over the second support, which may be designated by $B\ B_2$, then the other negative moments are given by the ordinates in the triangle or polygon $A\ B\ B_2$. The difference of the ordinates of the two polygons determines the magnitude and kind of bending moment at each apex of the first span. The load P_1^2 induces a positive moment over the second support, which may be designated by $C\ C_2$, then the ordinates between the lines $B\ C$ and $B_2\ C_2$ will give us the moments at the apices of the second span. The

moments in the third span are given by the ordinates between the lines $C_2\ D$ and $C\ D$.

Having given an outline of the method, we will now proceed to give it in detail.

First.—Assume some value for P_1^2, as unity, ten or one hundred.

Second.—Form the stress diagram, Fig. 16, assuming for the pole distance some value as unity, ten or one hundred. Assume the pole in such a position, that the closing line $A\ B$ to the equilibrium polygon $A\ c_1\ B$ shall be horizontal, and construct the equilibrium polygon $A\ c_1\ B$.

Third.—From Table (a), we find the bending moment over the second support to be $-13.54\ P_1^2$; now, if $P_1^2=1$, and the pole distance $=1$, then the ordinate $B\ B_2=13.54$, laid off to the scale of $A\ B$. Draw $A\ B_2$. Scale the ordinates $b_1\ b_2$, $c_1\ c_2$, etc., and place the results in Table (c), column 3, opposite P_1^1, P_2^2, etc. The results will be found to agree with those computed.

Fourth.—From Table (a), we find that $C\ C_2=+3.762\ P_1^2$; hence, lay off $C\ C_2=3.76$ to scale of $A\ B$, and draw $B_2\ C_2$ and $C_2\ D$ and fill out the remainder of column 3, Table (c), by scaling the ordinates between these lines and the horizontal.

In like manner, each column of Table (c) can be filled in a comparatively short time.

To fill Table (b), proceed as follows:

First.—Draw $G\ H$, Fig. 16, parallel to $A\ B_2$, then $E\ H=S_1$ and $F\ H=S_2'$.

Second.—Draw $G\ H_1$ parallel to $B_2\ C_2$, then $K\ H_1=S_2 = -S_3'$.

Third.—Draw $G\ H_2$ parallel to $C_2\ D$, then $K\ H_2=-S_3 = +S_4'$.

Proceed in like manner with each load.

$$\beta_2''=\theta_1\ (l_2+F_2')=520\ (121.061)\ E'= \ldots\ldots 62{,}951.7\ E'$$

$$\beta_3''=\theta_2\ (l_3+F_3')=560\ (112.415)\ E'= \ldots\ldots 62{,}952.4\ E'$$

$$\beta_4''=\theta_3\ (l_4+F_4')=520\ (42.481)\ E'= \ldots\ldots 22{,}090.1\ E'$$

Since $k_r= \frac{a_r}{l_r}$, $\Sigma\ P_r\ l_r\ (1-k_r)=\Sigma\ P_r\ (l_r-a_r)$. Now, we have, from (k), for a uniform load, $\Sigma\ P_r=\int_0^{l_r} w_r\ d\ a_r$,

$$\therefore\ \Sigma\ P_r\ l_r\ (1-k_r)=\int_0^{l_r} w_r\ d\ a_r\ (l_r-a_r)= \frac{1}{2}\ w_r\ l_r^2, \text{ and we}$$

can write

$$\Sigma P_1 l_1 (1-k_1) = \frac{1}{2} w_1 l_1^2 = \frac{1}{2} \cdot 6.7 \cdot 2704 = \ldots\ldots 9{,}058.4$$

$$\Sigma P_2 l_2 (1-k_2) = \frac{1}{2} w_2 l_2^2 = \frac{1}{2} \cdot 6.7 \cdot 4225 = \ldots\ldots 14{,}153.7$$

$$\Sigma P_3 l_3 (1-k_3) = \frac{1}{2} w_3 l_3^2 = \frac{1}{2} \cdot 2.2 \cdot 4225 = \ldots\ldots 4{,}647.5$$

$$\Sigma P_4 l_4 (1-k_4) = \frac{1}{2} w_4 l_4^2 = \frac{1}{2} \cdot 6.7 \cdot 2704 = \ldots\ldots 9{,}058.4$$

Also,

$$\Sigma P_r (e_v - a_r)^2 = \int_0^{e_v} w_r \, d\, a_r (e_v - a_r)^2 = \frac{1}{4} w_r e_v^4$$

$$\Sigma P_r (e_v - a_r)^2 = \int_0^{e_v} w_r \, d\, a_r (e_v - a_r)^2 = \frac{1}{3} w_r e_v^3$$

Substituting these values in (f) and (g), they become

$$H_r = \sum_{v=l_r}^{v=1} \triangle_v^r \left\{ \frac{w_r e_v^4}{4 l_r} + \frac{3 (l_r - e_r)}{l_r} \frac{w_r e_v^3}{3} \right\}$$

$$= \sum_{v=l_r}^{v=1} \triangle_r^r \frac{w_r e_r^3}{4} \left\{ 4 - 3 \frac{e_r}{l_r} \right\}$$

$$H_r' = \sum_{v=l_r}^{v=1} \triangle_v^r \left\{ \frac{w_r e_v^4}{4 l_r} - \frac{3 e_v}{l_r} \frac{w_r e_v^3}{3} \right\}$$

$$= \sum_{v=l_r}^{v=1} \triangle_r^r \frac{3 w_r}{4} \left\{ - \frac{e_v^4}{l_r} \right\}$$

From (75), $A_r = -\frac{1}{4} w_r l_r^3 \theta_{r-1}$.

From (77), $B_r = -\frac{1}{4} w_r l_r^3 \theta_{r+1}$.

Therefore, $A_2 = -\frac{1}{4} w_2 l_2^3 \theta_1 = -239{,}198{,}375\ E'$

$$A_3 = -\frac{1}{4} w_3 l_3^3 \theta_2 = -\ 84{,}584{,}500\ E'$$

$$A_4 = -\frac{1}{4} w_4 l_4^3 \theta_3 = -\ 122{,}469{,}568\ E'$$

$$B_1 = -\frac{1}{4} w_1 l_1^3 \theta_2 = -\ 131{,}890{,}304\ E'$$

$$B_2 = -\frac{1}{4} w_2 l_2^3 \theta_3 = -\ 239{,}198{,}375\ E'$$

$$B_3 = -\frac{1}{4} w_3 l_3^3 \theta_4 = -\ 36{,}250{,}500\ E'$$

From (p), since $c_1=0$, and $c_2=1$,

$$c_3=\frac{-2\,\beta_2'}{\beta_2}=-3.557. \qquad c_4=\frac{-2\,c_3\,\beta_3'-\beta_2''}{\beta_3}=+29.33.$$

$$c_5=\frac{-2\,c_4\,\beta_4'-c_3\,\beta_3''}{\beta_4}=\frac{-2{,}590{,}360\;E'}{\beta_4}$$

From (r), since $d_1=0$, and $d_2=1$,

$$d_3=\frac{-\beta_4'}{\beta_3''}=-1.524. \qquad d_4=\frac{-2\,d_3\,\beta_3'-\beta_3}{\beta_2''}=+5.385.$$

$$d_5=\frac{-2\,d_4\,\beta_2'-d_3\,\beta_2}{\beta_1''}=\frac{-1{,}109{,}880\;E'}{\beta_1''}$$

Therefore,

$$M_2=\frac{-1}{-1{,}109{,}880\;E'}\left\{\begin{array}{l}\left(\begin{array}{r}-239{,}198{,}375\;E'\\-\;101{,}703{,}032\;E'\\\hline-311{,}716{,}223\;E'\end{array}\right)\;5.385\\ \left(\begin{array}{r}-\;84{,}584{,}500\;E'\\-202{,}036{,}278\;E'\\\hline-262{,}260{,}904\;E'\end{array}\right.\;\begin{array}{r}-60{,}224{,}626\;E'\\-239{,}198{,}375E'\end{array}\;\Big)\;(-1.524)\\ \left(\begin{array}{r}-122{,}469{,}568\;E'\\-\;27{,}029{,}904\;E'\\\hline-\;4{,}881{,}977\;E'\end{array}\right.\;\begin{array}{r}+\;22{,}147{,}927\;E'\\-36{,}250{,}500\;E'\end{array}\;\Big)\end{array}\right\}$$

$$+\frac{-5{,}385\;(2.33)}{-2{,}590{,}360\;E'}\;(-131{,}890{,}304\;E')$$

$$M_2=\frac{1}{1{,}109{,}880}\left\{\begin{array}{r}-2{,}966{,}675{,}110\\+\;893{,}130{,}719\\-\;163{,}602{,}045\end{array}\right\}+\frac{12.565}{2{,}590{,}360}\;(-131{,}890{,}304)$$

$$M_2=-2015.66-639.68=-2656.$$

The moments, produced by the loads in the respective spans, can be easily deduced, as follows:

First span loaded—

$$M_2=\frac{-d_4\,\beta_3''\,\beta_2''}{(c_5\,\beta_4)\,\beta_3\,\beta_2}\;B_1+\frac{-1}{(d_5\,\beta_1'')}\;X_1''\,d_4.$$

Or,

$$M_2=\left\{\begin{array}{l}+\;\dfrac{1}{1{,}109{,}880}\;(-101{,}703{,}032)\;(5{,}385)\\ \\+\;\dfrac{12{,}565}{2{,}590{,}360}\;(-131{,}890{,}304)\end{array}\right\}=\begin{array}{r}-494\\-640\\\hline-1134\end{array}$$

Second span loaded—

$$M_2 = \frac{-1}{(d_5\ \beta_1')} \begin{Bmatrix} (A_2 + X_2)\ d_4 \\ (X_2'' + B_2)\ d_2 \end{Bmatrix}$$

$$M_2 = \frac{1}{1,109,880} \begin{Bmatrix} (-230,159,375 - 210,913,191) & (-5,346) \\ (-201,016,379 - 230,159,375) & (-1,524) \end{Bmatrix} = \ldots\ldots\ldots -1574$$

Third span loaded—

$$M_2 = \frac{-1}{(d_5\ \beta_1')} \begin{Bmatrix} (A_3 + X_3')\ d_3 \\ (X_3'' + B_3) \end{Bmatrix}$$

$$M_2 = \frac{1}{1,109,880} \begin{Bmatrix} (-84,584,500 - 80,224,636) & (-1,524) \\ (-27,029,304 - 36,250,500) \end{Bmatrix} = \ldots\ldots\ldots +142$$

Fourth span loaded—

$$M_2 = \frac{-1}{(d_4\ \beta_1')} \left\{ A_4 + X_4' \right\}$$

$$M_2 = \frac{1}{1,109,880} \begin{Bmatrix} -122,469,568 \\ +\ 22,147,927 \end{Bmatrix} = \ldots\ldots\ldots -90$$

$$\text{Sum} = -2656$$

THE SAME EXAMPLE WITH *I* CONSTANT.

$$M_2 = \frac{-c_2}{d_5\ l_1} \begin{Bmatrix} A_2\ d_4 + B_2\ d_3 \\ A_3\ d_3 + B_3 \\ A_4 \end{Bmatrix} + \frac{-d_4}{c_5\ l_4}\ B_1$$

$$c_1 = 0,\ c_2 = 1,\ c_3 = -3.6,\ c_4 = +13.4,\ c_5 = -\frac{2901.6}{52}$$

$$d_1 = 0,\ d_2 = 1,\ d_3 = -3.6,\ d_4 = +13.4,\ d_5 = -\frac{2901.6}{52}$$

$$A_2 = -\frac{1}{4}\ w_2\ l_2^3 \qquad A_3 = -\frac{1}{4}\ v_3\ l_3^3 \qquad A_4 = -\frac{1}{4}\ w_4\ l_4^3$$

$$B_1 = -\frac{1}{4}\ w_1\ l_1^3 \qquad B_2 = -\frac{1}{4}\ w_2\ l_2^3 \qquad B_3 = -\frac{1}{4}\ v_3\ l_3^3$$

Then,

$$M_2 = \frac{1}{2901.6} \begin{Bmatrix} -\frac{1}{4}\ w_2\ l_2^3\ (13.4) - \frac{1}{4}\ w_2\ l_2^3\ (-3.6) \\ -\frac{1}{4}\ v_3\ l_3^3\ (-3.6) - \frac{1}{4}\ v_3\ l_3^3 \\ -\frac{1}{4}\ w_4\ l_4^3 \qquad\qquad -\frac{1}{4}\ w_1\ l_1^3\ (13.4) \end{Bmatrix}$$

$$M_2 = \frac{1}{2901.6}\left\{\begin{array}{l} -\ 919{,}993.7\ w + 247{,}162.5\ w \\ +\ 247{,}162.5\ v - \ 68{,}656.2\ v \\ -\ 35{,}152{,}0\ w - 471{,}036.8\ w \end{array}\right\} = -\ 2587$$

The partial moments are easily obtained, as follows:

First span loaded—

$$M_2 = \frac{1}{2901.6}\ (-\ 471{,}036.8\ w) = \ldots\ldots\ldots -\ 1088$$

Second span loaded—

$$M_2 = \frac{1}{2901.6}\ (-\ 919{,}993.7\ w + 247{,}162.5\ w) = \ldots -\ 1554$$

Third span loaded—

$$M_2 = \frac{1}{2901.6}\ (247{,}162.5\ v - 68{,}656.2\ v) = \ldots\ldots +\ 136$$

Fourth span loaded—

$$M_2 = \frac{1}{2901.6}\ (-\ 35{,}126.0\ w) = \ldots\ldots\ldots -\ 81$$

Sum = — 2587

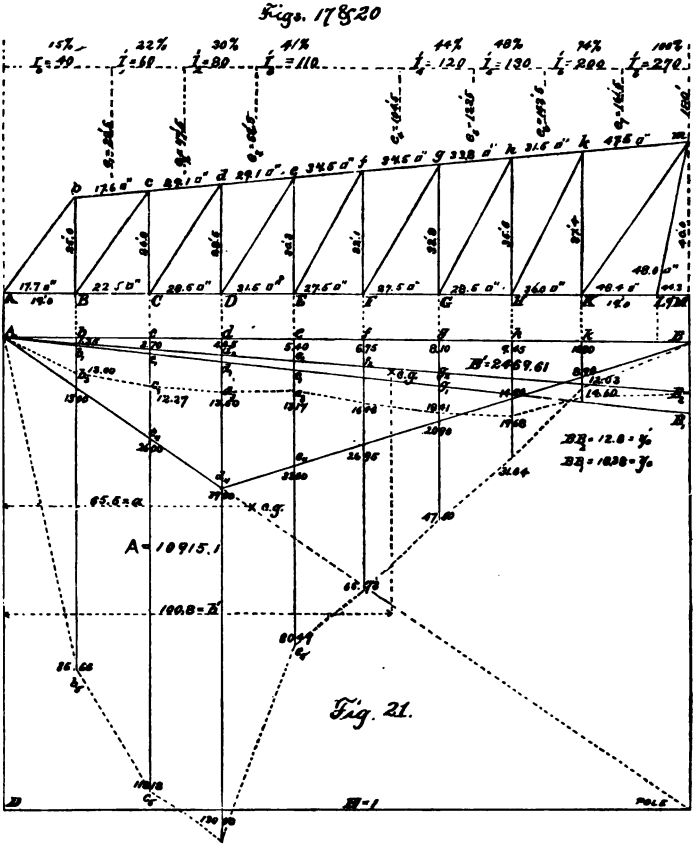
EXAMPLE 3.—THE SABULA DRAW.

We now propose to compare the bending moments in the Sabula Draw, considering the moment of inertia as constant and variable, respectively.



Variable moment of inertia—

From Fig. 20, is obtained the cross section of each mem-

ber, and the length of each vertical; the moments of inertia for each section are readily deduced as follows: neglecting the moment of inertia of the section of the member about its own axis, it being very small, in comparison with the moment of inertia of the truss section.

First Span.		Second Span.
I'_0	$=(17.7+17.6)\ (12.5\ )^2 \div 144 = 40 =$	I''_1
I'_1	$=(29.1+22.5)\ (13.4\ )^2 \div 144 = 60 =$	I''_0
I'_2	$=(29.1+28.5)\ (14.25)^2 \div 144 = 80 =$	I''_3
I'_3	$=(34.5+31.5)\ (15.15)^2 \div 144 = 110 =$	I''_4
I'_3	$=(34.5+27.5)\ (16.05)^2 \div 144 = 110 =$	I''_4
I'_4	$=(33.8+27.5)\ (16.9\ )^2 \div 144 = 120 =$	I''_3
I'_5	$=(31.5+28.5)\ (17.8\ )^2 \div 144 = 130 =$	I''_2
I'_6	$=(47.5+36.0)\ (18.7\ )^2 \div 144 = 200 =$	I''_1
I'_7	$=(47.5+48.0)\ (20.0\ )^2 \div 144 + 270 =$	I''_0

First Span.		Second Span.	
$e_1 = 28.5$	$e_4 = 104.5$	$e_1 = 18.5$	$e_4 = 75.5$
$e_2 = 47.5$	$e_5 = 123.5$	$e_2 = 37.5$	$e_5 = 113.5$
$e_3 = 66.5$	$e_6 = 142.5$	$e_3 = 56.5$	$e_6 = 132.5$
$e_7 = 161.5$		$e_7 = 151.5$	

From (124), we have,

$$M_2 = \frac{1}{2\,\beta''_2}\ (A_2 + B_1 + X'_2 + X''_1)$$

In which,

$$X'_2 = H_2\,\theta_1 - F'_2\ \Sigma\ P_2\ l_2\ (1 - k_2)\ \theta_1$$

$$X''_1 = -\ H'_1\,\theta_2 - 2\ F''_1\ \Sigma\ P_1\ l_1\ (1 - k_1)\ \theta_2$$

$$H_2 = \sum_{v=l_2}^{v=1} \triangle_v^2 \left\{ \frac{\Sigma\ P_2\ (e_v - a_2)^3}{l_2} + \frac{3\ (l_2 - e_v)}{l_2}\ \Sigma\ P_2\ (e_v - a_2)^2 \right\}$$

$$H_1 = \sum_{v=l_1}^{v=l} {}^{1}_{v} \left\{ \frac{\Sigma P\ (e_v - a_1)}{l} - \frac{3\ e_v}{l} \Sigma P_v\ (e_v - a_1)^2 \right\}$$

$$\beta_2 = 6\ E\ I_1\ (l_1 - F_1) - 6\ E\ I_2\ (l_2 - F_2)$$

$$F_1 = \sum_{v=l_1}^{v=l} {}^{1}_{v} \frac{e_v^2}{l_1^2}$$

$$F_2 = \sum_{v=l_2}^{v=l_1} {}^{2}_{v} e_v^2 \left(\frac{3}{l_2} - \frac{2\ e_v}{l_2^2} \right)$$

$$F_2 = \sum_{v=l_2}^{v=l_1} {}^{2}_{v} \left(\frac{l_2^3 - (l_2 - e_v)^3}{l_2^2} \right)$$

$$\overset{2}{\triangle}_v = \frac{{}^{2}I_l}{{}^{2}I_{v-1}} - \frac{{}^{2}I_l}{{}^{2}I_v} \qquad \overset{1}{\triangle}_v = \frac{{}^{1}I_l}{{}^{1}I_{v-1}} - \frac{{}^{1}I_l}{{}^{1}I_v}$$

We will first compute those co-efficients that do not depend upon the loading. For a uniform load over all,

$$H_2 = \sum_{v=l_2}^{v=l_1} {}^{2}_{v} \frac{w_2 e_v^3}{4} \left\{ 4 - 3 \frac{e_v}{l_2} \right\}$$

$$H_1 = \sum_{v=l_1}^{v=l} {}^{1}_{v} \frac{3 w_1}{4} \left\{ - \frac{e_v^4}{l_1} \right\}$$

First span—

		$-\triangle^{1}_{r} e^{4}_{r}$
$e_1 = 28.5$	$\triangle_1 = + 2.250$	- - 1,484,437
$e_2 = 47.5$	$\triangle_2 = + 1.125$	— 5,726,996
$e_3 = 66.5$	$\triangle_3 = + 0.921$	— 18,011,347
$e_4 = 104.5$	$\triangle_4 = + 0.204$	— 24,327,379
$e_5 = 123.5$	$\triangle_5 = + 0.173$	— 40,245,185
$e_6 = 142.5$	$\triangle_6 = + 0.727$	— 299,773,934
$e_7 = 161.5$	$\triangle_7 = + 0.350$	-- 238,099,317
		— 627,668,595

Multiplying this sum by $\frac{3\,w_1}{4\,l_1}$, we obtain $-2{,}615{,}286\ w_1 = H_1'$.

Second span—

		$\triangle^{2}_{v} e^{3}_{v} \frac{(4\,l_2 - 3\,e_v)}{l_2}$
$e_1 = 18.5$	$\triangle_1 = - 0.052$	— 1,215
$e_2 = 37.5$	$\triangle_2 = - 0.107$	— 19,043
$e_3 = 56.5$	$\triangle_3 = - 0.026$	— 14,342
$e_4 = 75.5$	$\triangle_4 = - 0.030$	— 35,397
$e_5 = 113.5$	$\triangle_5 = - 0.137$	— 422,318
$e_6 = 132.5$	$\triangle_6 = - 0.166$	— 691,825
$e_7 = 151.5$	$\triangle_7 = - 0.333$	— 1,709,655
		— 2,893,795

Multiplying this sum by $\frac{w_2}{4}$, we obtain $-723{,}449\ w_2 = H_2$.

First span—$l_2 = 180'$—

$e_1 = 28.5$	$\triangle_1 = + 2.250$	$\triangle_1\, e_1^3 = +$ 52,085
$e_2 = 47.5$	$\triangle_2 = + 1.125$	$\triangle_2\, e_2^3 = +$ 120,568

			$l_2^3 = 32,400$) —3,347,951	$l_2^3 = 32,400$) —4,287,311
			$-103.33 = F_2'$	$-132.32 = F_2$

Next find the values of X_2 and X_1', for a uniform load over all.

$\theta_1 = 270\,E'$, $\theta_2 = 40\,E'$, in which $E' = 6\,E$.

$+ H_2\,\theta_1 = -\ 723{,}449\ (270)\ E'\ w_2 =$ — 195,331,230 $w_2\,E'$

$-\ \dfrac{F_2'}{2}\ w_2\,l_2^3\,\theta_1 = +\ \dfrac{103.33}{2}$

$(32{,}400)\ (270)\ E'\ w_2 =$ + 451,965,420 $w_2\,E'$

+ 256,634,190 $w_2\,E'$

$-F_1''\theta_2\,w_1\,l_1^3 = -141.36\,(32{,}400)(40) w_1\,E' =$ — 183,202,560 $w_1\,E'$

$-H_1'\,\theta_2 = +\ 2{,}615{,}286\ (40)\ w_1\,E' =$ + 104,611,440 $w_1\,E'$

— 78,591,120 $w_1\,E'$

$\beta_2' = 40\ (180 + 141.36)\ E' + 270\,(180 - 132.32)\ E' = +25{,}728\ E'$.

$A_2 = -\ \dfrac{1}{4}\ w_2\,l_2^3\ 270\ E' = -\ 393{,}660{,}000\ E'\ w_2$.

$B_1 = -\ \dfrac{1}{4}\ w_1\,l_1^3\ 40\ E' = -\ 58{,}320{,}000\ E'\ w_1$.

Then,

$$M_2 = \frac{1}{51456E'}\left\{\begin{array}{l} -\ 393{,}660{,}000\ w_2\,E' \\ -\ 58{,}320{,}000\ w_1\,E' \\ -\ 78{,}591{,}120\ w_1\,E' \\ -\ 256{,}634{,}190\ w_2\,E' \end{array}\right\} = (\text{if } w_1 = w_2 = w) - 5322\ w.$$

First span alone loaded—

$$M_2 = \frac{1}{51456}\left\{\begin{array}{l} -\ 58{,}320{,}000\ w_1 \\ -\ 78{,}591{,}120\ w_1 \\ \hline -\ 137{,}000{,}000\ w_1 \end{array}\right\} = -\ 2661\ w_1.$$

Second span alone loaded—

$$M_2 = \frac{1}{51456}\left\{\begin{array}{l} -\ 393{,}660{,}000\ w_2 \\ +\ 256{,}834{,}190\ w_2 \\ \hline -\ 137{,}000{,}000\ w_2 \end{array}\right\} = -\ 2661\ w_2.$$

EXAMPLE 3*a*.

This is the same as Example 3, with the moment of inertia considered as constant.

From (142),

$$M_2 = \frac{A_2 + B_1}{2\,(l_1 + l_2)} = \frac{A_2 + B_1}{720}$$

$$A_2 = -\frac{1}{4}\ w_2\ l_2^3 = -\ 145{,}800\ w_2.$$

$$B_1 = -\frac{1}{4}\ w_1\ l_1^3 = -\ 145{,}800\ w_2.$$

Therefore,

$$M_2 = \left\{\begin{array}{l} -\ 2025\ w_1 \\ -\ 2025\ w_2 \end{array}\right\} \text{ and if } w_1 = w_2 = w,\ M_2 = -\ 4050\ w.$$

No. of Loaded Span.	M_2 *Bending Moment Variable I.*	M_2 *Bending Moment Constant I.*	*Difference.*
FIRST.	$-\ 2661\ w_1$	$-\ 2025\ w_1$	$636\ w_1$
SECOND.	$-\ 2661\ w_2$	$-\ 2025\ w_2$	$636\ w_2$
BOTH.	$-\ 5322\ w$	$-\ 4050\ w$	$1272\ w$

EXAMPLE 4.—CONCENTRATED LOADS.

Let us consider the Sabula Draw again, but with single concentrated loads, instead of uniform loads. Supports level. a_1 57. a_2 123.

See pages 73 and 74 for the value of M_r.

From Example 3:

β_2 40 (180 − 141.36) E' −270 (180—132.32) E' = − 25,728 E'.

F_1' − 141.36. F_2' =103.33. F_2 = — 132.32.

θ_1 270 E'. θ_2 40 E'.

The values of H_2 and H_1' depend upon the position of the loads. Let us take a load in the first span **57′** from the left support, and one in the second span **123′** from the left support; then we have for H_1' and H_2, the following:

First span— l_1=180′. a_1=57′.

$$H_1' = \frac{v}{v}\frac{1}{l_1}\left\{\Sigma\frac{P_r(e_r-a_1)^2}{l_1} - \frac{3e_r}{l_1}\Sigma P_r(e_r-a_1)^2\right\}$$

		$e-a_1$.		
e_1	28.5			
e_2	47.5			
e_3	66.5	9.5	Δ_3 = + 0.921	— 88 P_1
e_4	104.5	47.5	Δ_4 = + 0.204	— 680 P_1
e_5	123.5	66.5	Δ_5 = + 0.173	— 1,292 P_1
e_6	142.5	85.5	Δ_6 = + 0.727	— 10,097 P_1
e_7	161.5	104.5	Δ_7 = + 0.350	— 8,068 P_1
				— 20,225 P_1=H_1'.

NOTE.—e_r must always be greater than or equal to a_1.

Second span— l_2 180′. a_2=123′.

$$H_2 = \frac{r}{r}\frac{1}{l_2}\left\{\Sigma P_2(e_r-a_2)^3 \; \frac{3(l_2-e_r)}{l_2}\Sigma P_2(e_r-a_2)^2\right\}$$

$e_1 = 18.5$
$e_2 = 37.5 \quad e - a_2$
$e_3 = 56.5$
$e_4 = 75.5$
$e_5 = 113.5$
$e_6 = 132.5 \quad + 9.5 \quad \triangle_6 = -0.166 \quad -13\ P_2$
$e_7 = 151.5 \quad + 28.5 \quad \triangle_7 = -0.333 \quad -172\ P_2$

$-185\ P_2 = H_2$

NOTE.—e_n must always be greater than or equal to a_2.

$$X_2' = \begin{cases} + H_2\ \theta_1 = -185\ (270)\ E'\ P_2 = -49{,}950\ E'\ P_2 \\ - F_2'\ P_2\ (l_2 - a_2)\ \theta_1 = \\ \quad + 103.33\ (57)\ (270)\ E'\ P_2 = +1{,}590{,}248\ E'\ P_2 \end{cases}$$

$$+1{,}540{,}298\ E'\ P_2$$

$$X_1'' = \begin{cases} - H_1'\ \theta_2 = +20{,}225\ P_1\ (40)\ E' = +809{,}000\ E'\ P_1 \\ -2\ F_1''\ P_1\ (l_1 - a_1)\ \theta_2 = \\ \quad -141.36\ (123)\ (80)\ E'\ P_1 = -1{,}390{,}928\ E'\ P_1 \end{cases}$$

$$-581{,}928\ E'\ P_1$$

From (i) and (j),

$$A_2 = -P_2\ l_2^2\ (2k - 3k^2 + k^3)\ 6\ E'\ I_1',$$

Or, by Table I,

$$A_2 = -P_2\ l_2^2\ (0.285{,}144)\ 270\ E' = -2{,}494{,}269\ E'\ P_2.$$

$$B_1 = -P_1\ l_1^2\ (0.285{,}144)\ 40\ E' = -369{,}520\ E'\ P_1.$$

Therefore,

$$M_2 = \frac{1}{51456\ E'} \begin{Bmatrix} -2{,}494{,}269\ E'\ P_2 \\ +1{,}540{,}298\ E'\ P_2 \\ -369{,}520\ E'\ P_1 \\ -581{,}928\ E'\ P_1 \end{Bmatrix} = \begin{Bmatrix} -18.5\ P_2 \\ -18.5\ P_1 \end{Bmatrix}$$

Or, if $P_1 = P_2$,

$$M_2 = -37.0\ P.$$

First span alone loaded—

$$M_2 = \frac{1}{2\ \beta_2'}\ (B_1 + X_1'')$$

EXAMPLE 4.—CONCENTRATED LOADS.

Let us consider the Sabula Draw again, but with single concentrated loads, instead of uniform loads. Supports level. $a_1=57.$ $a_2=123.$

See pages 73 and 74 for the value of M_2.

From Example 3:

$\beta_2'=40\ (180+141.36)\ E'+270\ (180-132.32)\ E'=+25{,}728\ E'.$

$F_1''=+141.36.\quad F_2=103.33.\quad F_2=-132.32.$

$\theta_1=270\ E'.\quad \theta_2=40\ E'.$

The values of H_2 and H_1' depend upon the position of the loads. Let us take a load in the first span $57'$ from the left support, and one in the second span $123'$ from the left support; then we have for H_1' and H_2, the following:

First span— $l_1=180'.\quad a_1=57'.$

$$H_1'=\sum_{v=l_1}^{v=1} \Delta_v^1 \left\{ \frac{\Sigma P_1 (e_v-a_1)^2}{l_1} - \frac{3\,e_v}{l_1} \Sigma P_1 (e_v-a_1)^2 \right\}$$

$e_1=28.5$	$e-a_1.$			
$e_2=47.5$				
$e_3=66.5$	$+\ 9.5$	$\Delta_3=+0.921$	$-\ 88\ P_1$	
$e_4=104.5$	$+\ 47.5$	$\Delta_4=+0.204$	$-\ 680\ P_1$	
$e_5=123.5$	$+\ 66.5$	$\Delta_5=+0.173$	$-\ 1{,}292\ P_1$	
$e_6=142.5$	$+\ 85.5$	$\Delta_6=+0.727$	$-\ 10{,}097\ P_1$	
$e_7=161.5$	$+\ 104.5$	$\Delta_7=+0.350$	$-\ 8{,}068\ P_1$	
			$-\ 20{,}225\ P_1=H_1'.$	

NOTE.—e_v must always be greater than or equal to a_1.

Second span— $l_2=180'.\quad a_2=123'.$

$$H_2=\sum_{v=l_2}^{v=1} \Delta_v^2 \left\{ \frac{\Sigma P_2 (e_v-a_2)^3}{l_2} + \frac{3\,(l_2-e_v)}{l_2} \Sigma P_2 (e_v-a_2)^2 \right\}$$

$e_1 = 18.5$
$e_2 = 37.5 \quad e - a_2$
$e_3 = 56.5$
$e_4 = 75.5$
$e_5 = 113.5$
$e_6 = 132.5 \quad + 9.5 \quad \triangle_6 = -0.166 \quad -13\ P_2$
$e_7 = 151.5 \quad + 28.5 \quad \triangle_7 = -0.333 \quad -172\ P_2$

$$-185\ P_2 = H_2$$

NOTE.—e_v must always be greater than or equal to a_2.

$$X_2' = \begin{cases} +H_2\ \theta_1 = -185\ (270)\ E'\ P_2 = -49{,}950\ E'\ P_2 \\ -F_2'\ P_2\ (l_2 - a_2)\ \theta_1 = \\ \quad +103.33\ (57)\ (270)\ E'\ P_2 = +1{,}590{,}248\ E'\ P_2 \end{cases}$$

$$+1{,}540{,}298\ E'\ P_2$$

$$X_1'' = \begin{cases} -H_1'\ \theta_2 = +20{,}225\ P_1\ (40)\ E' = +809{,}000\ E'\ P_1 \\ -2\ F_1''\ P_1\ (l_1 - a_1)\ \theta_2 = \\ \quad -141.36\ (123)\ (80)\ E'\ P_1 = -1{,}390{,}928\ E'\ P_1 \end{cases}$$

$$-581{,}928\ E'\ P_1$$

From (i) and (j),

$$A_2 = -P_2\ l_2^2\ (2k - 3k^2 + k^3)\ 6\ E'\ I_1'$$

Or, by Table I,

$$A_2 = -P_2\ l_2^2\ (0.285{,}144)\ 270\ E' = -2{,}494{,}269\ E'\ P_2.$$

$$B_1 = -P_1\ l_1^2\ (0.285{,}144)\ 40\ E' = -369{,}520\ E'\ P_1.$$

Therefore,

$$M_2 = \frac{1}{51456\ E'} \begin{Bmatrix} -2{,}494{,}269\ E'\ P_2 \\ +1{,}540{,}298\ E'\ P_2 \\ -369{,}520\ E'\ P_1 \\ -581{,}928\ E'\ P_1 \end{Bmatrix} = \begin{Bmatrix} -18.5\ P_2 \\ -18.5\ P_1 \end{Bmatrix}$$

Or, if $P_1 = P_2$,

$$M_2 = -37.0\ P.$$

First span alone loaded—

$$M_2 = \frac{1}{2\ \beta_2'}\ (B_1 + X_1'')$$

Or,

$$M_2 = \frac{1}{51456}\left\{ -951{,}448\ P_1 \right\} = 18.5\ P_1.$$

Second span alone loaded--

$$M_2 = \frac{1}{2\ \beta_2'}\left\{ A_2 + X_2' \right\}$$

Or,

$$M_2 = \frac{1}{51456}\left\{ -953{,}961\ P_2 \right\} = 18.5\ P_2.$$

Since P_1 and P_2 are symmetrical about the center of the draw, the moments over the center pier should be equal, as shown above. If our work was absolutely correct, and decimals had been used to several places, the quantities in the parentheses above would have been the same; as it is, the quotients are practically equal.

* EXAMPLE 4 BY GRAPHICS.

For any load in the first span of a two span girder, we have, from *Greene's Trusses and Arches, Part II*,

$$\Sigma \frac{x_1\ y_1}{E\ I} - \Sigma \frac{x_1'\ y_1'}{E\ I} = \Sigma \frac{x_2'\ y_2'}{E\ I}$$

In which:

x_1=The distance from the left support to the ordinate y_1 of the equilibrium polygon $A\ C\ B$. Fig. 21, page 72.

y_1=Any ordinate of the polygon $A\ C\ B$.

x_1'=The distance from the left support to the ordinate y_1' of the polygon $A\ B\ B_1$.

y_1'=Any ordinate of the polygon $A\ B\ B_1$.

x_2'=The distance from the *right* support to any ordinate y_2' of a polygon in the second span, similar to $A\ B\ B_1$.

* For this excellent graphical method, the author is indebted to R. H. Brown, C. E., First Assistant Engineer of Boston Bridge Works.

y_2'=Any ordinate of the above polygon.

$\overset{1}{I}$=The moment of inertia of the cross section of the girder at any ordinate y_1'.

$\overset{2}{I}$=The moment of inertia of the cross section of the girder at any ordinate y_2'.

E=The modulus of elasticity.

Since $l_1=l_2=l$, and $\overset{1}{I}=\overset{2}{I}=I$, we have, considering E as constant,

$$\Sigma \frac{x_1 y_1}{I} = 2 \Sigma \frac{x_1' y_1'}{I}$$

Now, $\Sigma \frac{x_1 y_1}{I}$ equals an area multiplied by the distance of its center of gravity from the left support, and hence we may write $\Sigma \frac{x_1 y_1}{I} = A a$, in which A represents the area and a the c. g. distance.

In like manner, $2 \Sigma \frac{x_1' y_1'}{I} = 2 B b$. Therefore, we may write, $A a = 2 B b$.

With any scale, lay off the horizontal line $A B$, Fig. 21, and divide it into panel points at b, c, d, etc.

With any scale, preferably a large scale, lay off a load line $A D$, equal unity, and assume H also equal unity, then, assuming the pole in such a position that its closing line will be horizontal, construct the equilibrium polygon $A C B$ and scale its ordinates (the lengths are given in Fig. 21.)

Not knowing the proper position of the closing line, let us assume a position as $A B_2$, making $B B_2 = 12.8$, and scale the ordinates $b b_2$, $c c_2$, etc.

Divide each ordinate of the polygon $A C B$ by its proper I (given in per cent. of the center I above Fig. 21), and lay

off the results downward from $A\ B$, forming the polygon $A\ b_5\ c_5\ .\ .\ .\ .\ B$. The ordinates are **86.66**, **118.18**, etc., as shown in Figure 21, page 72.

Now, find the area of this figure, either by computation or the planimeter, and also its center of gravity. The center of gravity is readily found by cutting the polygon out of stiff card board and balancing it upon a needle point.

The area $= 10915.1 = A$, and $a = 65.5$.

Proceed in like manner with the polygon $A\ B\ B_2$, deducing the figure $A\ b_3\ c_3\ .\ .\ .\ .\ B_2$, which has an area of $2469.61 = B'$, and $b' = 100.8$.

Let $B\ B_1$ represent the true magnitude of the pier ordinate y_0, then from the triangles $A\ B\ B_2$ and $A\ B\ B_1$, we have,

$y_0' : y_0 :: e\ e_2 : e\ e_1$, or, $e\ e_1 = \frac{y_0}{y_0'}\ e\ e_2$. Then,

$$\Sigma\ \frac{x_1'\ (c\,c_1)}{I} = \frac{y_0}{y_0'}\ \Sigma\ \frac{x_2'\ (e\,e_2)}{I}, \text{ or, } B\ b = \frac{y_0}{y_0'}\ B'\ b'.$$

Hence, $A\ a = 2\ \frac{y_0}{y_0'}\ B'\ b'$, and $y_0 = \frac{(A\ a)\ y_0'}{2\ B'\ b'}$,

Which becomes

$$y_0 = \frac{10915.1 \times 65.5 \times 12.8}{2 \times 2469.61 \times 100.8} = 18.38.$$

Since $H = 1$ and $P_1^3 = 1$, the bending moment over the center pier is $-$ **18.38** P_1^3. We obtained, by computation, $-$ **18.5** P_1^3, which shows the graphical method to be accurate enough for all practical purposes.

It would have been more correct to have taken the ordinates y at the points where the values of I change, but the result would have been but little different.

The above computations can be very readily made by means of Thatcher's Calculating Instrument.

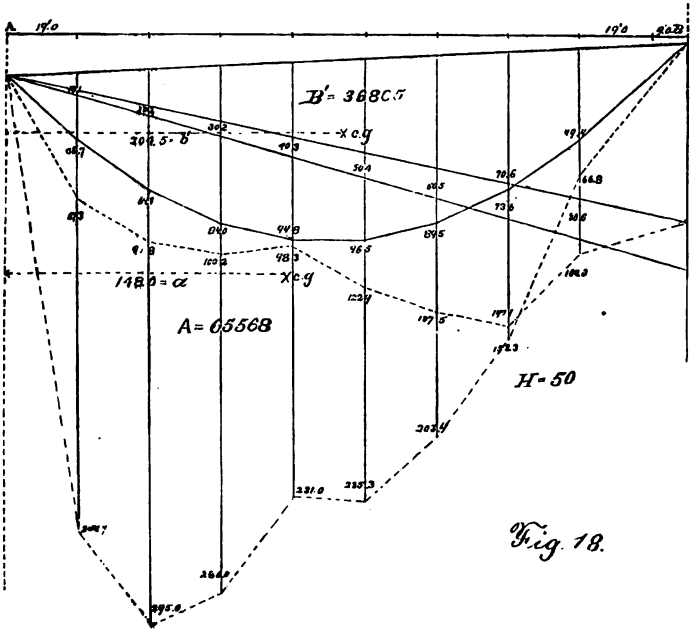

Fig. 18.

Fig. 17, page 72, and Fig. 18 are diagrams for the Sabula Draw, with a concentration at each apex in both spans.

($P_1'=P_1^2=P_2'=P_2^2=$&c.$=P=$23,000 lbs.)

$A\,a=B\,b$, or $A\,a=\frac{y_0}{y_0'}\,B'\,b$. Therefore,

$$y_0=\frac{(A\,a)\,y_0'}{B'\,b'}=\frac{65568\times148\times94.6}{36865\times204\,5}=121.800.$$

Since $H=50$, the bending moment over the pier is $121{,}800\times50=$ 6,090,000

Considering I as constant, the bending moment is 4,732,000

1,258,000=Diff.

APPENDIX.

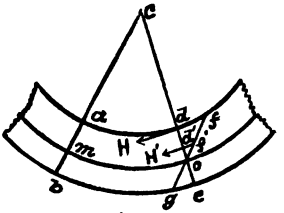

Fig. a.

* The general equation of the elastic line can be deduced as follows:

Vertical forces acting upon a girder cause a change of shape, lengthening the originally parallel fibres on one side, and shortening or compressing them on the other. Between the lengthened and shortened fibres there is a plane which undergoes no change in length; the centre line of this plane is called the *neutral axis or the elastic line.*

Thus, in Fig. (*a*), *m o* is the neutral axis, the fibres above being compressed, and those below lengthened. Upon the three following hypotheses we shall deduce the equation of the *elastic line.*

I. All planes perpendicular to the axis before the bending or flexure, preserve, during the bending, their perpendicularity and their forms as planes.

II. The change in length of a body subjected to a force, is, within certain limits, called the elastic limits, proportional to the intensity of the force.

* See Merriman's Theory and Calculation of Continuous Beams.

III. The change of shape is so small that the length of the neutral axis is sensibly the same as its horizontal projection.

In Fig. (*a*), we have a longitudinal section of a portion of a bent beam; the two planes *a b* and *d e* originally parallel, remaining perpendicular to the neutral axis or elastic line *m o*, and intersecting in *c* the centre of curvature. Hence, drawing *f g* parallel to *a b* through *o*, the lines *f d*, *g e*, etc., denote the elongation of the fibres, and we see, from the figure, that

$$o\,d : o\,d' :: d\,f : d'\,f' \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (22a)$$

or the change of length in the fibres is proportional to their distance from the neutral axis. *This is a consequence of the first hypothesis.*

Designating by *H* and *H'* the force acting in the fibres *d f* and *d' f'*, *the second hypothesis* gives

$$H : H' :: d\,f : d'\,f' \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (22b)$$

Combining (22*a*) and (22*b*), we have

$$H : H' :: o\,d : o\,d' \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (22c)$$

or, the horizontal forces are directly proportional to their distances from the neutral axis.

Denote the distance of any fibre from the neutral axis by *z*, the stress in it by *H'*, the distance of the remotest fibre by *e*, and its stress by *H*; then, from (22*c*), we obtain

$$H' : H :: z : e, \text{ or, } H' = \frac{H\,z}{e} \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (22d)$$

Thus far the cross-section of the fibres has been considered as unity. If the actual area is *a*, the force is $\frac{H a z}{e}$. Each of these forces *H'* tend to turn the beam around *o* with a lever arm *o d'* or *z*, hence the moment of the force is $\frac{H\,a\,z}{e} \times z = \frac{H\,a\,z^2}{e}$, and the sum of all the moments is

$$\overset{r}{M}_x = \frac{H}{e} \Sigma\, a\, z^2 \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22e)$$

$\overset{r}{M}_x$ meaning the bending moment at any section x_r of the beam in the span l_r.

Since $\Sigma\, a\, z^2$ is the expression for the moment of inertia of the section $a\, b$, (22e) becomes

$$\overset{r}{M}_x = \frac{H\, \overset{r}{I}_x}{e} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22f)$$

or the moment of the internal forces equals the stress in the remotest fibre times the moment of inertia of the section divided by the distance of the remotest fibre from the neutral axis.

The line $d\, f$ denotes the change of length in the fire $a\, d$, due to the force H, hence, if E be the co-efficient of elasticity,

$$a\, d : d\, f :: E : H \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22g)$$

Designating the radius $c\, o$ by γ_r, we have, from similar figures, $o\, d\, f$ and $c\, a\, d$. $(m\, o = a\, d)$.

$$a\, d : d\, f :: \gamma_r : e \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22h)$$

$$\frac{H}{e} = \frac{E}{\gamma_r}, \text{ or, } e = \frac{H\, \gamma_r}{E} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22i)$$

Substituting this value of e in (22f), we have

$$\overset{r}{M}_x = \frac{E\, \overset{r}{I}_x}{\gamma_r} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22k)$$

The radius of curvature of any plane curve, whose length is u_r and co ordinates x_r and y_r, is

$$\gamma_r = \frac{d\, u_r^2}{d\, x_r\, d^2\, y_r} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22l)$$

According to the third hypothesis, $d\, u_r = d\, x_r$, and (22l) becomes

$$\gamma_r = \frac{d\, x_r^2}{d^2\, y_r} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22m)$$

Substituting (22*m*) in (22*k*), it becomes

$$\frac{d^2 y_r}{d x_r^2} = \frac{\overset{r}{M}_x}{E \overset{r}{I}_x} \quad \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \quad (22)$$

Which is the differential equation of the elastic line, applicable to all bodies subjected to flexure which fulfill the conditions imposed by the *third hypothesis*. The values of E and I may be different for each and every section.

If (22) be integrated, it becomes

$$\frac{d y_r}{d x_r} = \frac{1}{E} \int_0^{x_r} \frac{\overset{r}{M}_x \, d \, x_r}{\overset{r}{I}_x} + C \quad \ldots \ldots \ldots \ldots \quad (23)$$

If $x_r = 0$, then $C = \frac{d y_r}{d x_r} = t_r$, and we have

$$\frac{d y_r}{d x_r} = t_r + \frac{1}{E} \int_0^{x_r} \frac{\overset{r}{M}_x d \, x_r}{\overset{r}{I}_x} \quad \ldots \ldots \ldots \ldots \ldots \quad (24)$$

Integrating again, (24) becomes

$$y_r = C' + t_r \int_0^{x_r} d \, x_r + \frac{1}{E} \int_0^{x_r} \frac{\overset{r}{M}_x \, d \, x_r}{\overset{r}{I}_x} \int_0^{x_r} d \, x_r \quad \ldots \ldots \quad (25)$$

If $x_r = 0$, then $C' = h_r$, and we have

$$y_r = h_r + t_r \, x_r + \frac{1}{E} \int_0^{x_r} \frac{\overset{r}{M}_x \, d \, x_r}{\overset{r}{I}_x} \int_0^{x_r} d \, x_r \quad \ldots \ldots \ldots \quad (26)$$

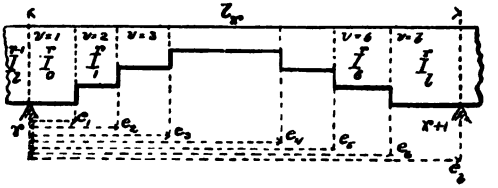

Fig. 2.

By examining Fig. 2, which represents a continuous girder having a variable cross-section, and consequently a variable moment of inertia, the following integration will be clearly understood:

* Integration of $\int_{0}^{x_r} \frac{\overset{r}{M}_x \, d \, x_r}{\overset{r}{I}_x}$

$$\int_{0}^{x_r} \frac{\overset{r}{M}_x \, d \, x_r}{\overset{r}{I}_x} = \frac{1}{\overset{r}{I}_0} \int_{0}^{e_1} \overset{r}{M}_x \, d \, x_r + \frac{1}{\overset{r}{I}_1} \int_{e_1}^{e_2} \overset{r}{M}_x \, d \, x_r \ldots$$

$$\ldots + \frac{1}{\overset{r}{I}_x} \int_{e_x}^{x} \overset{r}{M}_x \, d \, x_r \quad \ldots \quad (27)$$

But,

$$\frac{1}{\overset{r}{I}_v} \int_{v}^{e_{v+1}} \overset{r}{M}_x \, d \, x_r = \frac{1}{\overset{r}{I}_v} \int_{0}^{e_{v+1}} \overset{r}{M}_x \, d \, x_r - \frac{1}{\overset{r}{I}_v} \int_{0}^{e_v} \overset{r}{M}_x \, d \, x_r \ldots \ldots \quad (28)$$

Therefore, we can write for (27),

* See Weyrauch's Continuirlichen und Einfachen Träger, p. 168.

$$\int_0^{x_r} \frac{1}{I_x} M_x \, d\, x_r = \frac{1}{I_0} \int_0^{e_1} M_x \, d\, x_r + \frac{1}{I_1} \int_0^{e_2} M_x \, d\, x_r \ldots$$

$$\ldots + \frac{1}{I_{x-1}} \int_0^{e_x} M_x \, d\, x_r$$

$$+ \frac{1}{I_1} \int_0^{e_1} M_x \, d\, x_r + \frac{1}{I_2} \int_0^{e_2} M_x \, d\, x_r \ldots + \frac{1}{I_x} \int_0^{e_x} M_x \, d\, x_r$$

$$+ \frac{1}{I_x} \int_0^{x_r} M_x \, d\, x_r \ldots\ldots\ldots (29)$$

Which reduces to

$$\int_0^{x_r} \frac{1}{I_x} M_x \, d\, x_r = \frac{1}{I_x} \int_0^{x_r} M_x \, d\, x_r$$

$$+ \sum_{v=x_r}^{v=1} \left(\frac{1}{I_{v-1}} - \frac{1}{I_v} \right) \int_0^{e_v} M_x \, d\, x_r \ldots\ldots (30)$$

Substituting (30) in (26), it reduces to

$$y_r = h_r + t_r x_r + \frac{1}{E} \left\{ \frac{1}{I_x} \int_0^{x_r} d\, x_r \int_0^{x_r} M_x \, d\, x_r \right.$$

$$\left. + \sum_{v=x_r}^{v=1} \left(\frac{1}{I_{v-1}} - \frac{1}{I_v} \right) \int_0^{x_r} d\, x_r \int_0^{e_v} M_x \, d\, x_r \right\} \ldots (31)$$

From 8, we have $M_x = M_r + S_r x_r - \Sigma P_r (x_r - a_r) \ldots a \leq x \ldots (8)$

Hence,

$$\int_o^{x_r} \dot{M}_x \, d\, x_r = M_r\, x_r + \frac{1}{2} S_r\, x_r^2 - \frac{1}{2} \Sigma P_r\, (x_r - a_r)^2 \ldots a \leqq x \ldots (32)$$

And,

$$\int_o^{x_r} d\, x_r \int_o^{x_r} \dot{M}_x \, d\, x_r = \frac{1}{2} M_r\, x_r^2 + \frac{1}{6} S_r\, x_r^3 - \frac{1}{6} \Sigma P_r\, (x_r - a_r)^3 \ldots a \leqq x \ldots (33)$$

Now,

$$\int_o^{x_r} d\, x_r \int_o^{e_v} \dot{M}_x \, d\, x_r = \int_o^{e_v} d\, x \int_o^{e_v} \dot{M}_x \, d\, x_r + \int_{e_v}^{x_r} d\, x_r \int_o^{e_v} \dot{M}_x \, d\, x_r \ldots\ldots (34)$$

But,

$$\int_o^{e_r} \dot{M}_x \, d\, x_r = M_r\, e_v + \frac{1}{2} S_r\, e_v^2 - \frac{1}{2} \Sigma P_r\, (e_v - a_r)^2 \ldots a \leqq e \ldots (35)$$

Hence,

$$\int_o^{e_r} d\, x_r \int_o^{e_v} \dot{M}_x \, d\, x_r = \frac{1}{2} M_r\, e_r^2 + \frac{1}{6} S_r\, e_v^3 - \frac{1}{6} \Sigma P_r\, (e_v - a_r)^3 \ldots a \leqq e \ldots (36)$$

$$\int_{e_v}^{x_r} d\, x_r = x_r - e_v,$$

Therefore,

$$\int_{e_r}^{x_r} d\,x_r \int_{0}^{e_r} M_x'\,d\,x_r = -\frac{1}{2}(x_r-e_r)\left\{2\,M_r\,e_r+S_r\,e_r^2 - \Sigma\,P_r\,(e_r-a_r)^2\right\} \quad \ldots\ldots (37)$$

Substituting (33), (34), (36) and (37) in (31), it becomes

$$y_r = h_r + t_r\,x_r + \frac{1}{6\,E\,I_x'}\left\{3\,M_r\,x_r^2 + S_r\,x_r^3 - \Sigma\,P_r\,(x_r-a_r)^3\right\}$$
$$+ \frac{1}{6\,E\,I_x'}\sum_{v=x_r}^{v=1}\left(\frac{I_x'}{I_{v-1}'}-\frac{I_x'}{I_v'}\right)\left\{3\,M_r\,e_v^2+S_r\,e_v^3-\Sigma\,P_r\,(e_v-a_r)^3 + 3\,(x_r-e_v)\,[2\,M_r\,e_v+S_r\,e_v^2-\Sigma\,P_r\,(e_v-a_r)^2]\right\} \quad \ldots (38)$$

Which reduces to

$$y_r = h_r + t_r\,x_r + \frac{1}{6\,E\,I_x'}\left\{3\,M_r\,x_r^2 - S_r\,x_r^3 - \Sigma\,P_r\,(x_r-a_r)^3\right\}$$
$$- \frac{1}{6\,E\,I_x'}\sum_{v=x_r}^{v=1}\left(\frac{I_x'}{I_{v-1}'}-\frac{I_x'}{I_v'}\right)\left\{3\,M_r\,e_v\,(2\,x_r-e_v)+S_r\,e_v^2\,(3\,x_r-e_v) - \Sigma\,P_r\,(e_v-a_r)^3-3\,(x_r-e_v)\,\Sigma\,P_r\,(e_v-a_r)^2\right\} \quad \ldots (39)$$

If we make $x_r=l_r$, then $y_r=h_{r+1}$, $e_r=e_l$, and $I_x'=I_l'$.

Let $\frac{I_l'}{I_{v-1}'}-\frac{I_l'}{I_v'}=\frac{I_l'}{I_v'}\,\epsilon_v$, then, from (39), we have

$$h_{r+1} = h_r + t_r\,l_r + \frac{1}{6\,E\,I_l'}\left\{3\,M_r\,l_r^2 + S_r\,l_r^3 - \Sigma\,P_r\,(l_r-a_r)^3\right\}$$
$$+ \frac{1}{6\,E\,I_l'}\sum_{v=l_r}^{v=1}\frac{I_l'}{I_v'}\,\epsilon_v\left\{3\,M_r\,e_v\,(2\,l_r-e_v)+S_r\,e_v^2\,(3\,l_r-2\,e_v) - \Sigma\,P_r\,(e_v-a_r)^3-3\,(l_r-e_v)\,\Sigma\,P_r\,(e_v-a_r)^2\right\} \quad \ldots (40)$$

From (10),

$$S_r = \frac{M_{r+1}-M_r+\Sigma\,P_r\,l_r\,(1-k_r)}{l_r} \quad \ldots\ldots (10)$$

But, since $k_r = \frac{a_r}{l_r}$, this becomes

$$S_r = \frac{M_{r+1} - M_r + \Sigma P_r (l_r - a_r)}{l_r} \quad \ldots\ldots\ldots\ldots (10a)$$

Substituting (10a) in (40), and solving for t_r, we obtain

$$t_r = \frac{h_{r+1} - h_r}{l_r} - \frac{1}{6 E I_l l_r} \Big\{ 2 M_r l_r^2 + M_{r+1} l_r^2 + \Sigma P_r a_r (l_r - a_r) (2 l_r - a_r) \Big\}$$

$$- \frac{1}{6 E I_l l_r} \sum_{v=l_r}^{v=1} \Delta_r \Big\{ 2 M_r e_v \left(3 l_r - 3 e_v - \frac{e_v^2}{l_r}\right) + M_{r+1} e_v^2 \left(3 - \frac{2 e_v}{l_r}\right)$$

$$+ e_v^2 \left(3 - \frac{2 e_v}{l_r}\right) \Sigma P_r (l_r - a_r) - \Sigma P_r (e_v - a_r)^3 - 3 (l_r - e_v) \Sigma P_r (e_v - a_r)^2 \Big\} \quad \ldots\ldots (41)$$

Since $a_r = k_r l_r$, $a_r (l_r - a_r) (2 l_r - a_r) = l_r^3 (2 k_r - 3 k_r^2 + k_r^3)$, $l_r - a_r = l_r (1 - k_r)$, and (41) reduces to

$$t_r = \frac{h_{r+1} - h_r}{l_r} - \frac{1}{6 E I_l} \Big\{ 2 M_r l_r + M_{r+1} l_r + \Sigma P_r l_r^2 (2 k_r - 3 k_r^2 + k_r^3) \Big\}$$

$$- \frac{1}{6 E I_l l_r} \sum_{v=l_r}^{v=1} \Delta_r \Big\{ 2 M_r e_v \left(3 l_r - 3 e_v + \frac{e_v^2}{l_r}\right) + M_{r+1} e_v^2 \left(3 - \frac{2 e_v}{l_r}\right)$$

$$+ e_v^2 \left(3 - \frac{2 e_v}{l_r}\right) \Sigma P_r l_r (1 - k_r) - \Sigma P_r (e_v - a_r)^3 - 3 (l_r - e_v) \Sigma P_r (e_v - a_r)^2 \Big\} \quad \ldots\ldots (42)$$

Returning to (24),

$$\frac{d y_r}{d x_r} = t_r + \frac{1}{E} \int_0^{x_r} \frac{M_x \, d x_r}{I_x} \quad \ldots\ldots\ldots\ldots (24)$$

Substituting (32) and (35) in (30), and the result in (24), it becomes

$$\frac{d\,y_r}{d\,x_r} = t_r + \frac{1}{2\,E\,\overset{r}{I}_x}\left\{ 2\,M_r\,x_r + S_r\,x_r^2 - \Sigma\,P_r\,(x_r - a_r)^2 \right\}$$
$$+ \frac{1}{2\,E\,\overset{r}{I}_x} \sum_{v=x_r}^{v=l} \left(\frac{\overset{r}{I}_x}{\overset{r}{I}_{v-1}} - \frac{\overset{r}{I}_x}{\overset{r}{I}_v} \right)$$
$$\left\{ 2\,M_r\,e_r + S_r\,e_r^2 - \Sigma\,P_r\,(e_r - a_r)^2 \right\} \quad . \quad . \quad . \quad . \quad (43)$$

Making $x_r = l_r$, then $\frac{d\,y_r}{d\,x_r} = t_{r+1}$, $e_r = e_l$, and $\overset{r}{I}_x = \overset{r}{I}_l$, and substituting for S_r its value from (10), t_r from (42), and $k_r\,l_r$ for a_r in (43), it becomes

$$t_{r+1} = \frac{h_{r+1} - h_r}{l_r} - \frac{1}{6\,E\,\overset{r}{I}_l}\left\{ 2\,M_r\,l_r + M_{r+1}\,l_r \right.$$
$$\left. + P_r\,l_r^2\,(2\,k_r - 3\,k_r^2 + k_r^3) \right\}$$
$$- \frac{1}{6\,E\,\overset{r}{I}_l\,l_r} \sum_{v=l_r}^{v=l} \overset{r}{\triangle}_v \left\{ 2\,M_r\,e_r\,(3\,l_r - 3\,e_r + \frac{e_r^2}{l_r}) \right.$$
$$\left. + M_{r+1}\,e_r^2\,(3 - \frac{2\,e_r}{l_r}) \right.$$
$$\left. + e_r^2\,(3 - \frac{2\,e_v}{l_r})\,\Sigma\,P_r\,l_r\,(1 - k_r) - \Sigma\,P_r\,(e_r - a_r)^3 \right.$$
$$\left. - 3\,(l_r - e_r)\,\Sigma\,P_r\,(e_r - a_r)^2 \right\}$$
$$+ \frac{1}{6\,E\,\overset{r}{I}_l}\left\{ 3\,M_r\,l_r + 3\,M_{r+1}\,l_r + 3\,\Sigma\,P_r\,l_r^2\,(k_r - k_r^2) \right\}$$
$$+ \frac{1}{6\,E\,\overset{r}{I}_l\,l_r} \sum_{v=l_r}^{v=l} \overset{r}{\triangle}_v \left\{ 3\,M_r\,e_v\,l_r\,(2 - \frac{e_r}{l_r}) - 3\,M_{r+1}\,e_r^2 \right.$$
$$\left. + 3\,\Sigma\,P_r\,(1 - k_r)\,e_r^2\,l_r - 3\,l_r\,\Sigma\,P_r\,(e_r - a_r)^2 \right\} \quad . \quad . \quad . \quad . \quad (44)$$

Which reduces to

$$t_{r+1} = \frac{h_{r+1} - h_r}{l_r} + \frac{1}{6\,E\,\overset{r}{I}_l}\left\{ M_r\,l_r + 2\,M_{r+1}\,l_r + \Sigma\,P_r\,l_r^2\,(k_r - k_r^2) \right\}$$

$$+\frac{1}{6\,E\,I_r\,l_r}\sum_{v=l_r}^{v=1}{}^{r}\triangle_v\left\{M_r\,e_v^2\left(3-\frac{2\,e_v}{l_r}\right)+2\,M_{r+1}\frac{e_v^2}{l_r}\right.$$

$$\left.+\frac{2\,e_v^2}{l_r}\Sigma P_r\,l_r\,(1-k_r)-3\,e_v\Sigma P_r\,(e_v-a_r)^2+\Sigma P_r\,(e_v-a_r)^3\right\}\quad(45)$$

If we were to suppose loads in the $r-1^{th}$ span at distances $a_{r-1}=k_{r-1}\,l_{r-1}$ from the left support $r-1$, we would find in a similar manner, or by *decreasing* the subscripts of (45) by unity,

$$t_r=\frac{h_r-h_{r-1}}{l_{r-1}}+\frac{1}{6\,E\,I_l^{r-1}}\left\{M_{r-1}\,l_{r-1}+2\,M_r\,l_{r-1}\right.$$

$$\left.+\Sigma P_{r-1}\,l_{r-1}^2\,(k_{r-1}-k_{r-1}^3)\right\}$$

$$+\frac{1}{6\,E\,I_l^{r-1}\,l_{r-1}}\sum_{v=l_{r-1}}^{v=1}{}^{r-1}\triangle_v\left\{M_{r-1}\,e_v^2\left(3-\frac{2\,e_v}{l_{r-1}}\right)\right.$$

$$+2\,M_r\frac{e_v^2}{l_{r-1}}+\frac{2\,e_v^2}{l_{r-1}}\Sigma P_{r-1}\,l_{r-1}\,(1-k_{r-1})$$

$$\left.-3\,e_v\Sigma P_{r-1}\,(e_v+a_{r-1})^2+\Sigma P_{r-1}\,(e_v-a_{r-1})^3\right\}\quad\ldots\quad(46)$$

Equating (42) and (46), we obtain

$$\frac{h_{r+1}-h_r}{l_r}+\frac{1}{6\,E\,I_l^{r}}\left\{-2\,M_r\,l_r-M_{r+1}\,l_r-\Sigma P_r\,l_r^2\,(2\,k_r-3\,k_r^2+k_r^3)\right.$$

$$-\sum_{v=l_r}^{v=1}{}^{r}\triangle_v\,e_v\left(3-\frac{3\,e_v}{l_r}+\frac{e_v^2}{l_r^2}\right)2\,M_r-\sum_{v=l_r}^{v=1}{}^{r}\triangle_v\,e_v^2$$

$$\left(\frac{3}{l_r}-\frac{2\,e_v}{l_r^2}\right)M_{r+1}-\sum_{v=l_r}^{v=1}{}^{r}\triangle_v\,e_v^2\left(\frac{3}{l_r}-\frac{2\,e_v}{l_r^2}\right)$$

$$\Sigma P_r\,l_r\,(1-k_r)+\sum_{v=l_r}^{v=1}{}^{r}\triangle_v\frac{1}{l_r}\Sigma P_r\,(e_r-a_r)^3+\sum_{v=l_r}^{v=1}{}^{r}\triangle_v$$

$$\left.\left(\frac{3\,(l_r-e_v)}{l_r}\right)\Sigma P_r\,(e_r-a_r)^2\right\}=\frac{h_r-h_{r-1}}{l_{r-1}}-\frac{1}{6\,E\,I_l^{r-1}}$$

$$\left\{ M_{r-1}\, l_{r-1} + 2\, M_r\, l_{r-1} + \Sigma_{v=1}^{v=l_{r-1}} P_{r-1}\, l_{r-1}^2\, (k_{r-1} - k_{r-1}^2) + \Sigma_{v=l_{r-1}}^{r-1} \triangle_r \epsilon_v^2 \right.$$

$$\left(\frac{3}{l_{r-1}} - \frac{2\, e_r}{l_{r-1}^2} \right) M_{r-1} + \Sigma_{v=l_{r-1}}^{r=1} \triangle_r \frac{e_r^2}{l_{r-1}^2}\, 2\, M_r + \Sigma_{v=l_{r-1}}^{v=1} \triangle_r \frac{2\, e_r^2}{l_{r-1}^2}$$

$$\cdot \Sigma_{v=1}^{v=l_{r-1}} P_{r-1}\, l_{r-1}\, (1 - k_{r-1}) - \Sigma_{v=l_{r-1}}^{r-1} \triangle_r \frac{3\, e_r}{l_{r-1}} \Sigma_{v=1}^{v=l_{r-1}} P_{r-1}\, (e_r - a_{r-1})^2$$

$$+ \Sigma_{v=l_{r-1}}^{r-1} \triangle_r \frac{1}{l_{r-1}} \Sigma_{v=1}^{v=l_{r-1}} P_{r-1}\, (e_r - a_{r-1})^2 \left. \right\} \quad . \quad . \quad . \quad . \quad (47)$$

Let

$$\Sigma_{v=l_r}^{v=1} \triangle_r^r \left(3 - \frac{3\, e_r}{l_r} + \frac{e_r^2}{l_r^2} \right) = F_r \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (48)$$

$$\Sigma_{v=l_r}^{v=1} \triangle_r^r \left(\frac{3}{l_r} - \frac{2\, e_r}{l_r^2} \right) e_r^2 = F_r' \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (49)$$

$$\Sigma_{v=l_r}^{v=1} \triangle_r^r \frac{e_r^3}{l_r} = F_r'' \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (50)$$

$$6\, E\, I_l^r = \theta_r \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (51)$$

$$\Sigma_{v=l_r}^{v=1} \triangle_r^r \left\{ \frac{\Sigma P_r\, (e_r - a_r)^3}{l_r} + \frac{3\, (l_r - e_r)}{l_r} \Sigma P_r\, (e_r - a_r)^2 \right\} = H_r \quad . \quad . \quad (52)$$

$$\Sigma_{v=l_r}^{v=1} \triangle_r^r \left\{ \frac{\Sigma P_r\, (e_r - a_r)^3}{l_r} - \frac{3\, e_r}{l_r} \Sigma P_r\, (e_r - a_r)^2 \right\} = H_r' \quad . \quad . \quad (53)$$

Substituting (48), (49), (50), (51), (52) and (53) in (47), transposing and reducing, we obtain

$$- \theta_r \theta_{r-1} \frac{h_{r-1}-h_r}{l_r} + 2 M_r l_r \theta_{r-1} + M_{r+1} l_r \theta_{r-1} + \Sigma P_r l_r^2 (2 k_r - 3 k_r^2 + k_r^3) \theta_{r-1} + F_r 2 M_r \theta_{r-1} + F_r' M_{r+1} \theta_{r-1} + F_r' \Sigma P_r l_r (1-k_r) \theta_{r-1} - H_r \theta_{r-1} + \frac{h_r+h_{r-1}}{l_{r-1}} \theta_r \theta_{r-1} + M_{r-1} l_{r-1} \theta_r + 2 M_r l_{r-1} \theta_r + \Sigma P_{r-1} l_{r-1}^2 (k_{r-1}-k_{r-1}^2) \theta_r + F_{r-1}' M_{r-1} \theta_r + F_{r-1}'' 2 M_r \theta_r + F_{r-1}'' 2 \Sigma P_{r-1} l_{r-1} (1-k_{r-1}) \theta_r + H_{r-1}' \theta_r = 0 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (54)$$

Which reduces to

$$M_{r-1} (l_{r-1} + F_{r-1}') \theta_r + 2 M_r \left\{ (l_r + F_r) \theta_{r-1} + (l_{r-1} + F_{r-1}'') \theta_r \right\} + M_{r+1} (l_r + F_r') \theta_{r-1} = - \theta_r \theta_{r-1} \left\{ \frac{h_r - h_{r-1}}{l_{r-1}} + \frac{h_r - h_{r+1}}{l_r} \right\} + \Sigma P_r l_r^2 (2 k_r - 3 k_r^2 + k_r^3) \theta_{r-1} - F_r' \Sigma P_r l_r (1-k_r) \theta_{r-1} - \Sigma P_{r-1} l_{r-1}^2 (k_{r-1} - k_{r-1}^3) \theta_r - F_{r-1}'' 2 \Sigma P_{r-1} l_{r-1} (1-k_{r-1}) \theta_r + H_r \theta_{r-1} - H_{r-1}' \theta_r \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (55)$$

Let

$$- \theta_r \theta_{r-1} \left\{ \frac{h_r - h_{r-1}}{l_{r-1}} + \frac{h_r - h_{r+1}}{l_r} \right\} = Y_r \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (56)$$

$$- \Sigma P_r l_r^2 (2 k_r - 3 k_r^2 + k_r^3) \theta_{r-1} = A_r \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (57)$$

$$- \Sigma P_r l_r^2 (k_r - k_r^3) \theta_{r+1} = B_r \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (58)$$

$$\left. \begin{array}{l} - F_r' \Sigma P_r l_r (1-k_r) \theta_{r-1} + H_r \theta_{r-1} = X_r' \quad . \quad . \\ - 2 F_{r-1}'' \Sigma P_{r-1} l_{r-1} (1-k_{r-1}) \theta_r - H_{r-1}' \theta_r = X_{r-1}'' \end{array} \right\} = X_r \quad . \quad . \quad . \quad . \quad (59) \quad . \quad . \quad . \quad (59a)$$

$$\theta_{r+1} (l_r + F_r') = \beta_r \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (60)$$

$$\theta_r (l_{r-1} + F_{r-1}'') + \theta_{r-1} (l_r + F_r) = \beta_r' \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (61)$$

$$\theta_{r-1} (l_r + F_r') = \beta_r'' \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (62)$$

Then we can write

$$M_{r-1} \beta_{r-1} + 2 M_r \beta_r' + M_{r+1} \beta_r'' = A_r + B_{r-1} + Y_r + X_r \quad . \quad . \quad . \quad . \quad (63)$$

Which is the general form of the *Theorem of three moments.* It expresses the relation between the bending moments over three consecutive supports in terms of the loads, spans, E, I and h. An equation of the form of (63) can be written for every support, and, as, if the girder *rests* on the supports, the moment at the first and last support is zero, we shall

have as many equations as there are unknown quantities or bending moments, and hence we can determine their values.

Let there be s spans in the continuous girder represented in Fig. 1, and let the r^{th} span alone be loaded, then by the three moment theorem, the equation for each support is as follows:

$$\left.\begin{array}{rrrrrrrrrrrrr}
 & & & & 2M_2 & \beta'_2 & + & M_3 & \beta''_2 & = & 0 & & \\
M_2 & \beta_2 & + & 2M_3 & \beta'_3 & + & M_4 & \beta''_3 & = & 0 & & & \\
\times & \times & & \times & \times & & \times & \times & & & & & \\
M_{r-1} & \beta_{r-1} & + & 2M_r & \beta'_r & + & M_{r+1} & \beta''_r & = & Y_r + & A_r + & X_r & \\
M_r & \beta_r & + & 2M_{r+1} & \beta'_{r+1} & + & M_{r+2} & \beta''_{r+1} & = & B_r & & & \\
\times & \times & & \times & \times & & \times & \times & & & & & \\
M_{s-2} & \beta_{s-2} & + & 2M_{s-1} & \beta'_{s-1} & + & M_s & \beta''_{s-1} & = & 0 & & & \\
M_{s-1} & \beta_{s-1} & + & 2M_s & \beta'_s & & & & = & 0 & & &
\end{array}\right\} \quad . \quad . \quad (64)$$

Multiplying the first equation of (64) by c_2, the second by c_3, the r^{th} by c_r, etc, we obtain, after reduction,

$$\begin{array}{l}
M_2 (2c_2\beta'_2 + c_3\beta_2) + M_3 (c_2\beta''_2 + 2c_3\beta'_3 + c_4\beta_3) \\
\qquad\qquad + M_4 (c_3\beta''_3 + 2c_4\beta'_4 + c_5\beta_4) \\
\times \qquad \times \qquad \times \qquad \times \qquad \times \\
\quad + M_{s-1} (c_{s-2}\beta''_{s-2} + 2c_{s-1}\beta'_{s-1} + c_s\beta_{s-1}) \\
\quad + M_s (\beta''_{s-1}c_{s-1} + 2c_s\beta'_s) = Y_r c_r + X_r c_r + A_r c_r B_r c_{r-1} \quad . \quad (65)
\end{array}$$

Now, supposing it is desired to determine the value of M_s, it is only necessary to impose such conditions upon the multiplier c that all terms shall reduce to zero, excepting those containing M_s. Evidently, the co-efficients must separately equal zero, or

$$\left.\begin{array}{rrrrrrrrr}
 & & 2c_2\beta'_2 & + & c_3\beta_2 & = & 0 & & \\
c_2\beta''_2 & + & 2c_3\beta'_3 & + & c_4\beta_3 & = & 0 & & \\
c_3\beta''_3 & + & 2c_4\beta'_4 & + & c_5\beta_4 & = & 0 & & \\
\times & & \times & & \times & & & & \\
c_{m-1}\beta''_{m-1} & + & 2c_m\beta'_m & + & c_{m+1}\beta_m & = & 0 & &
\end{array}\right\} \quad . \quad . \quad . \quad . \quad . \quad . \quad (66)$$

And, for M_s, we have, at once,

$$M_s = \frac{(Y_r + X_r) c_r + A_r c_r + B_r c_{r+1}}{(c_{s-1}\beta''_{s-1} + 2c_s\beta'_s) = -c_{s+1}\beta_s} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (67)$$

In a similar manner, multiplying the last equation of (64) by d_2, the last but one by d_3, and so on, we obtain

$$\left.\begin{array}{l} 2\,d_2\,\beta'_s + d_3\,\beta''_{s-1}=0 \\ d_2\,\beta_{s-1} + 2\,d_3\,\beta'_{s-1} + d_4\,\beta''_{s-2}=0 \\ d_3\,\beta_{s-2} + 2\,d_4\,\beta'_{s-2} + d_5\,\beta''_{s-3}=0 \\ \times \quad\quad \times \quad\quad \times \quad\quad \times \\ d_{m-1}\,\beta_{s-m+2} + 2\,d_m\,\beta'_{s-m+2} + d_{m+1}\,\beta''_{s-m+1}=0 \end{array}\right\} \quad \ldots\ldots \quad (68)$$

And

$$M_2 = \frac{(Y_r + X_r)\,d_{s-r+2} + A_r\,d_{s-r+2} + B_r\,d_{s-r+1}}{(2\,\beta'_2\,d_s + d_{s-1}\,\beta_2) = -\,d_{s+1}\,\beta''_1} \quad \ldots\ldots \quad (69)$$

From (65), we see that $M_3 = -\frac{2\,\beta'_2}{\beta''_2}\,M_2$, from (66), $c_3 = -\frac{2\,c_2\,\beta'_3}{\beta_2}$; hence, assuming $c_1=0$ and $c_2=1$, we have $M_3=c_3\,\frac{\beta_2}{\beta''_2}\,M_2$, and in a similar manner we find that $M_4=c_4\,\frac{\beta_2\,\beta_3}{\beta''_2\,\beta''_3}\,M_2$, $M_5=c_5\,\frac{\beta_2\,\beta_3\,\beta_4}{\beta''_2\,\beta''_3\,\beta''_4}\,M_2$, or in general for any support *on the left* of the loaded span or spans.

$m<r+1$

$$M_m = c_m\,\frac{\beta_2\,\beta_3 \cdot \cdot \beta_{m-1}}{\beta''_2\,\beta''_3 \cdot \cdot \beta_{m-1}}\,M_2 \quad \ldots\ldots\ldots\ldots \quad (70)$$

In a like manner, we obtain for any support *on the right* of the loaded span or spans,

$m>r$

$$M_m = d_{s-m+2}\,\frac{\beta''_{s-1}\,\beta''_{s-2} \cdot \cdot \beta''_m}{\beta_{s-1}\,\beta_{s-2} \cdot \cdot \beta_m}\,M_s \quad \ldots\ldots\ldots\ldots \quad (71)$$

Substituting (69) in (70), and (67) in (71), we obtain

$m<r+1$

$$M_m = -\,\frac{c_m\,\beta_2\,\beta_3 \cdot \cdot \beta_{m-1}}{(d_{s+1}\,\beta''_1)\,\beta''_2 \cdot \cdot \beta''_{m-1}} \left\{(A_r + Y_r + X_r)\,d_{s-r+2} + B_r\,d_{s-r+1}\right\} \quad (72)$$

$$M_m = -\,\frac{d_{s-m+2}\,\beta''_{s-1}\,\beta''_{s-2} \cdot \cdot \beta''_m}{(c_{s+1}\,\beta_3)\,\beta_{s-1}\,\beta_{s-2} \cdot \cdot \beta_m} \left\{(A_r + Y_r + X_r)\,c_r + B_r\,c_{r+1}\right\} \quad \ldots (73)$$

In (72), as m must always be *less* than $r+1$, r can have values from s to m.

In (73), as m must always be *greater* than r, r can have values from 1 to $m-1$.

Hence, adding (72) and (73), and substituting $X_r' + X_{r-1}''$ for X_r, we have

$$M_m = \frac{-c_m \beta_2 \beta_3 \ldots \beta_{m-1}}{(d_{s+1} \beta_1'') \beta_2'' \beta_3'' \ldots \beta_{m-1}''} \sum_{r=s}^{r=m} \left\{ (A_r + Y_r + X_r' + X_{r-1}'') d_{s-r+2} + B_r d_{s-r+1} \right\}$$

$$+ \frac{-d_{s-m+2}}{(c_{s+1} \beta_s'')} \frac{\beta_{s-1}''}{\beta_{s-1}} \frac{\beta_{s-2}'' \ldots \beta_m''}{\beta_{s-2} \ldots \beta_m} \sum_{r=m-1}^{r=1} \left\{ (A_r + Y_r + X_r' + X_{r-1}'') c_r + B_1 c_{r+1} \right\} (A)$$

From (A), we can obtain the bending moment over any support m of a continuous girder of any number of spans s, of any lengths as $l_1, l_2 \ldots l_s$, supports at any levels, the moment of inertia I constant or variable, the modulus of elasticity E being constant, and the loads being placed at pleasure.

Note that $\beta_2'' \leqq \beta_{m-1}''$, $\beta_2 \leqq \beta_{m-1}$, $\beta_{s-1}'' \geqq \beta_m''$, and $\beta_{s-1} \geqq \beta_m$.

SUMMARY.

PAGE.

Nomenclature 1–2

I.

GENERAL RELATIONS.

Conditions of equilibrium—(I), (II) and (III) . . . 4
Moment equations for single concentrated load—(1) and (2) 4
Moment equations for concentrated loads—(8) and (9) 5
Moment equations for partial uniform loads—(13), (14) and (15) 5–6
Moment equations for uniform load over all—(18) and (19) 6

MOMENTS.

General equations for the moment over any support; the modulus of elasticity, E, alone, being considered constant.

Moment equation (*A*) 7

Concentrated loads—
Values of A_r and B_r—(*i*) and (*j*) 8
Values of X_r', X_{r-1}'' and H_r —(*h*), (*h*) and (*f*) . . . 9
Value of H_r'—(*g*) 10

Partial uniform loads—
Values of A_r and B_r—(74) and (76) 8
Values of X_r' and X_{r-1}''—(78) and (80) 9
Value of H_r—(*f*), (82) and (83) 9–10
Value of H_r'—(*g*), (82) and (83) 10–11

Uniform load over all—
Values of A_r and B_r—(75) and (77) 8
Values of X_r' and X_{r-1}''—(79) and (81) 9
Value of H_r—(*f*), (84) and (85) 9–10
Value of H_r'—(*g*), (84) and (85) 10–11

For all loads—
Values of F_r, F_r', F_r'' and Δ_r—(*b*), (*c*), (*d*) and (*a*) . . 11
Values of β_r, β_r', β_r'', Y_r, θ_r, c_m and d_m—(*m*), (*n*), (*o*), (*l*), (*e*), (*p*) and (*r*) 12

The modulus of elasticity, E, and the moment of inertia, I, being constant.

Moment equation (A_1) 12
Concentrated loads, values of A_r and B_r—(i_1) and (j_1) . 13
Partial uniform loads, values of A_r and B_r—(86) and (88) 13
Uniform load over all, values of A_r and B_r—(87) and (89) 13

For all loads—
Values of c_m, d_m and Y_r—(p_1), (r_1) and (l_1) 13

*The modulus of elasticity, **E**, the moment of inertia, **I**, and the length of the spans being constant.*

Moment equation (A_2) 14
Concentrated loads, values of A_r and B_r—(i_2) and (j_2) . 14
Partial uniform loads, values of A_r and B_r—(90) and (92) 14
Uniform load over all, values of A_r and B_r—(91) and (93) 14–15

For all loads—
Values of c_m, d_m and Y_r—(p_2), (r_2) and (l_2) 14–15

GENERAL EQUATIONS FOR SHEAR.

General equation (*B*), value of S_r 15
General equation (*C*), value of S_r' 16
Concentrated loads, values of Q_r and Q_r'—(94) and (95) 16
Partial uniform loads, values of Q_r and Q_r'—(96) and (97) 16
Uniform load over all, values of Q_r and Q_r'—(98) and (99) 16

GENERAL EQUATIONS FOR INTERMEDIATE BENDING MOMENTS.

General equation (*D*) 16
Concentrated loads, value of L_r—(100) . . . . . 5 and 16
Partial uniform loads, value of L_r—(101) . . . . . 6 and 16
Uniform load over all, value of L_r—(102) . . . . . 7 and 16

GENERAL EQUATIONS FOR DEFLECTION.

***E**, alone, constant.*
General equation (*E*), value of y_r 17
Value of t_{r+1}—(45) 17

***E** and **I** constant.*
General equation (E_1), value of y_r 17
Value of t_{r+1}—(45*a*) 17

II.

SUPPORTED GIRDERS.

GIRDER RESTING UPON TWO SUPPORTS.

(*a*) ***E**, alone, constant.*

Values of M_1 and M_2—(103) 19

Concentrated loads—
Values of S_1 and S_2'—(106) and (107) 19
Value of M_x'—(113) 20
Value of y_1—(117) 20

Partial uniform loads—
Values of S_1 and S_2'—(108) and (109) 19
Value of M_x'—(114) 20
Value of y_1—(117) . . . See (12), p. 18 20

Uniform load over all—
Values of S_1 and S_2'—(110) and (111) 19–20
Value of M_x'—(115) 20
Value of M_c—(116) 20
Value of y_1—(117) . . . See (12), p. 18 20

(*b*) ***E** and **I** constant.*

Value of y_1—(119) . . (concentrated loads) 21

A BEAM CONTINUOUS OVER THREE SUPPORTS.

(*a*) ***E**, alone, constant.*

Value of M_1, M_2 and M_3—(120) and (121) 21
Value of M_2—(124) 21
Concentrated loads, values of A_2 and B_1—(135) and (136) 23
Partial uniform load, values of A_2 and B_1—(137) and (138) 23
Uniform load over all, values of A_2 and B_1—(139) and (140) 23

For all loads—
Values of c_1, c_2 and c_3—(122) 21
Values of d_1, d_2 and d_3—(123) 21
Values of X_2', X_1'', H_2 and H_1'—(125), (126), (127) and (128) 22
Values of Δ_1, Δ_2, F_2', F_1'' and F_2—(129), (130), (131), (132) and (133) 22
Values of β_2' and Y_2—(133*a*) and (134) 22

Shears, equations (*B*) and (*C*) 15–16
Moments, intermediate—(*D*) 16
Deflection—(*E*) and (45) 17

(*b*) ***E*** *and* ***I*** *constant.*

Values of M_1 and M_3—(141) 23
Value of M_2—(142) 24

Concentrated loads—
Value of M_2—(150) 24
Values of A_2 and B_1—(144) and (145) 24
Values of S_1, S_2', S_2 and S_3'—(153) to (157) 25
Partial uniform loads, values of A_2 and B_1—(146) and (147) 24

Uniform load over all—
Value of M_2—(158) 25
Values of S_1, S_2', S_2 and S_3'—(159) to (163) 25–26

For all loads—
Value of Y_2—(143) 24

(*c*) ***E***, ***I*** *and* ***h*** *constant.*

Same as case (*b*), with $Y_2=0$ 26

(*d*) ***E***, ***I***, ***h*** *and* ***l*** *constant.*

Concentrated loads—
Value of M_2—(164) 26
Values of S_1, S_2', S_2 and S_3'—(165) to (169) 26

Uniform load over all—
Value of M_2—(170) 26
Values of S_1, S_2'', S_2' and S_3'—(171) to (174) 26–27

A BEAM CONTINUOUS OVER FOUR SUPPORTS.

(*a*) ***E***, *alone, constant.*

Values of M_1 and M_4—(175) 27
Values of M_2 and M_3—(177) and (178) 27
See General Relations for other equations 27

(*b*) ***E*** *and* ***I*** *constant.*

Values of M_2 and M_3—(179) and (180) 28
See General Relations for other equations . . . . .

(*c*) ***E***, ***I*** *and* ***h*** *constant.*

Values of M_2 and M_3—(181) and (182) 28
See General Relations for other equations . . . . .

(*d*) ***E, I, h*** *and* ***l*** *constant.*
Values of M_2 and M_3—(183) and (184) 28
Uniform load over all—
Values of M_2 and M_3—(185) and (186) 28
Uniform load over all and spans equal—
Values of M_2 and M_3—(187) and (188) 28
Values of S_1, S_1', S_2, S_2', S_3 and S_3''—(189) to (196) . . . 29

THE TIPPER.

(*a*) ***E****, alone, constant.*
Value of h_2—(217) 31
Values of Y_2 and Y_3—(210) and (211) 31
Values of M_2 and M_3—(177) and (178) 27
See General Relations for other equations . . . . . .

(*b*) ***E*** *and* ***I*** *constant.*
Values of Y_2 and Y_3 (233) 33
Values of M_2 and M_3—(179) and (180) 28
See General Relations for other equations . . . . . .

III.

BEAMS WITH FIXED ENDS.

A BEAM FIXED AT ONE END AND SUPPORTED AT THE OTHER.

(*a*) ***E****, alone, constant.*
Value of M_2—(234) 34
Concentrated loads, value of A_2—(144) 35
Partial uniform loads, value of A_2—(146) 36
Uniform load over all, value of A_2—(148) 36
For all loads
Values of Y_2, B_2' and X_2—(236) to (129) 35
Values of F_2', F_2, H_2 and X_2'—(131) to (238) 35
See General Relations for other equations . . . . . .

(*b*) ***E*** *and* ***I*** *constant.*
Value of M_2—(240) 36
Concentrated loads—
Value of M_2—(241) 36
Value of Y_2—(236) 35
Values of S_2 and S_2' (242) and (243) 36–37

Uniform load over all—
Value of M_x—(244) 37
Value of Y_x—(236) 35
Values of S_x and S_x'—(245) and (246) 37

(*c*) ***E***, ***I*** *and* ***h*** *constant.*

Concentrated loads—
Value of M_x—(247) 37
Values of S_x and S_x'—(248) and (249) 37

Uniform load over all—
Value of M_x—(250) 37
Values of S_x and S_x'—(251) and (252) 37–38

Value of $\overset{x}{M}$—(253) 38

Value of *Max.* $\overset{x}{M}$—(254) 38

Load at center of beam—
Value of M_x—(256) 38
Value of S_x and S_x'—(257) and (258) 38

Value of $\overset{x}{M}$—(259) or (260) 38

Value of *Max.* $\overset{x}{M}$—(261) 38
Value of y_x, if $h_x = h_x' = 0$—(262) or (263) 39

A BEAM FIXED AT BOTH ENDS.

(*a*) ***E***, *alone, constant.*

Values M_x and M_x'—(266) and (267) 40
Values of β_x', β_x', β_x, β_x'', Y_x and Y_x'—(268) to (273) . . 40
See General Relations for other equations.

(*b*) ***E*** *and* ***I*** *constant.*

Values of M_x and M_x'—(274) and (275) 40

(*c*) ***E***, ***I*** *and* ***h*** *constant.*

Values of M_x and M_x'—(276) and (277) 41

Concentrated loads—
Values of M_x and M_x'—(278) and (279) 41

Uniform load over all—
Values of M_x and M_x'—(280) 41
Values of S_x and S_x'—(281) 41

Value of $\overset{x}{M}$—(282) 41

Value of *Max.* $\overset{x}{M}$—(283) 41
Value of y_x—(284) 41

A single load in the center of the beam—
Values of M_x and M_x—(285) 41
Values of S_x and S_x' - (286) 41
Value of $\overset{x}{M}_x$—(287) or (288) 42
Value of *Max.* $\overset{x}{M}_x$—(289) 42
Value of y_x—(290) or (291) 42

A BEAM FIXED AT ONE END, AND UNSUPPORTED AT THE OTHER.

Concentrated loads—
Value of M_x—(292) 43
Value of S_x—(292) 43
Partial uniform loads—
Value of M_x—(293) 43
Value of S_x—(294) 43
Value of $\overset{x}{M}_x$—(295) 43
Value of y_x—***I*** *constant*—(297) 43
Single concentrated load, value of y_x—(298) 43
Load at end of beam, value of y_x—(299) 43
Uniform load over all, value of y_x—(300) 43

A BEAM ON TWO SUPPORTS, AND ONE END UNSUPPORTED.

Value of M_x—(301) 44
Value of S, S_x' and S_x—(302) to (304) 44
Values of $\overset{x}{M}_x$ and $\overset{x}{M}_x$—(305) and (306) 44

A BEAM ON ONE SUPPORT, HAVING ONE END FIXED, AND THE OTHER UNSUPPORTED.

(*a*) ***E***, *alone, constant.*
Values of M_x and M_x—(309) and (307) 45
(*b*) ***E*** *and* ***I*** *constant.*
Values of M_x and M_x—(310) and (307) 45
(*c*) ***E***, ***I*** *and* ***h*** *constant.*
Values of M_x and M_x—(311) and (307) 45

A BEAM ON TWO SUPPORTS, HAVING NEITHER END SUPPORTED.

Values of M_x and M_x—(312) and (313) 46

IV.

THE POINT OF ZERO MOMENT.

Load on the right, value of x_r—(316) 47
Load on the left, value of x_l—(317) 48
Values of x_r by Graphics 48–49

THE CO-EFFICIENTS *c* AND *d*.

Graphical determination of the values of c and d . . 50–51

V.

APPLICATIONS.

Example 1.—A continuous girder of three spans upon level supports, the two end spans being equal. Determination of bending moments and shears 52
Values of M_r and M_l for each load—Table (*a*) 53–54
Values of S, S', S_r, S_r', S_l and S_l'—Table (*b*) 55
Values of M_r—Table (*c*) 56
Maximum moments 58
Maximum shear 59
Example 1.—By graphics 60–61
Example 2.—A continuous girder of four spans with uniform loads and a variable cross section. Determination of moments 62–69
Example 2.—With a constant cross-section 70–71
A comparison of the results obtained, considering the moment of inertia as variable and then constant . 71
Example 3.—A continuous girder of two spans. The Sabula Draw uniformly loaded, and having a variable cross-section. Determination of the moment over the second support 72–76
Example 3*a*. The same as Example 3, but with a constant cross-section 77
Comparison of the results of Example 3 and Example 3*a* 77
Example 4.—The Sabula Draw, with concentrated loads and a variable cross-section. Determination of the moment over the second support 78–80
Example 4. By graphics 80–83

APPENDIX.

Demonstration of the equation of the *elastic line* . . . 85–88
General expression for the *Theorem of Three Moments* . 97
Demonstration of Equation (*A*) 89–100

TABLE I.

Values for $k-2\ k^3+k^5$ and $k-k^3$ for all ratios $\frac{a}{l} = k$ from .001 to .999, inclusive 101–106

REFERENCES.

Some references to monographs, periodicals, &c., which consider the theory of the continuous girder . . 107–108
